Hello everybody,

I have to apologize : the pseudo-dma routine in fpu3 is for SCSI only.
That's why I didn't got any speed difference on IDE.

I can't test it with my SCSI quantum lp105s because it stops at 1,1 Mo/s.

Regards

Let it go, you've earned that position if you ask me.
Furthermore, why bash all Hades users?

You must be aware by now that not all are fond of getting
replies with foul language, right?

Regards,

Joakim

Hi!

I'm relly new to ST programming (in C). Now, after having so much hacked
at EmuTOS I also would like to try out some "User Mode" programming. ;-)

If I would like to write a program just with VDI routines and without
using AES services, I think, I could simply just do this under TOS. But
what about the AES' screen, from which I do start? What can I do to
restore this completely after I returned from my program? Do I have to be
aware of special things, if such a program would run under MiNT?

I think of trying out some fullscreen stuff, similar to DirectX stuff,
what might run on M$ boxes.

If you run the program when AES is running
you have to lock the screen with a AES call wind_update(BEG_UPDATE)
and form_dial(FMD_START, x1, y1, w1, h1, x2, y2, w2, h2) to reserve the screen area.

End the program with wind_update(END_UPDATE)
and form_dial(FMD_FINISH, x1, y1, w1, h1, x2, y2, w2, h2)

Under MiNT:
If a AES is active, you must lock the screen (The AES runs independant of you)
The only correct way of locking the screen in such a case is wind_update, which is a AES call.

Under single TOS it depends on the desktop. Possibly the desktop locks the screen for you when you start a .TOS/TTP. In that case the desktop should also unlock and

redraw the screen when the .TOS/TTP program exits. It looks like the ATARI single TOS's
work like that. And emutos I hope ;-)

The problem however is that if you want to use the VDI, you must be a GEM program with extension .PRG, .GTP or .APP

The solution is:
Dont be afraid of the AES, just use it, if only for the wind_update.

```
appl_init
form_dial(FMD_START) on the full screen.
wind_update(BEG_UPDATE)

Do your fullscreen thing

wind_update(END_UPDATE)
form_dial(FMD_FINISH) on the full screen. /* redraws the desktop */
appl_exit
```

Why it's Steve Sour.
Still reading every post? lol
I only seen this post cause someone reqouted it.
Apparently when I have my head up my arse I find you? Not suprising.
Your position on my killfile doesn't randomly change, you'd know that
if you would ever learn to use one. However, be please in knowning your
right next sinclap...

> However, be please in knowning your right next sinclap...

I'm mortaly wounded, i thought we had a professional reationship at least,
but sharing a killfile step with sinclap is the root of offensive!.

Not of all us are like that. I can agree alittle with you though.
There are alot more Hades owners then what shows up in these
UerGroups. Sometimes I do get a message from some of them and it
usually makes interesting conversation.

Its nice to see a few of you who remember your roots, there's still lots of
relevant info in our old valve powered bases, hope to see you around for a
while yet.

Hello Steve,

Do not worry. I will be around here as long as I am alive. I even
go to the 8-bit section as I consider those days the best of my
computer experience.

Hiya Steve,

Yes the grey hairs are starting to come, but I still feel like a
kid when I fire up my 130XE. Even my own kids like to play around
with it. My youngest has a 1040ST in his room and loves it.

Well... with RTL8139 and my driver for MiNTnet, you get DMA on Hades/Milan. That 'no DMA with a 68060' is not really true.

Hi all,

Last year I wrote a small program to dismember Powerpoint files by
extracting the JPG, PNG and WAV data. It was only a simple program
but it did what I wanted at the time.

Today someone sent me a M$ DOC file which I was able to read with
Papyrus but it doesn't extract the image data. So I tried my little
program and was a little surprised to see both PNG files extracted.

I wonder if ROM would be intersted ?

One the subject of using Papyrus to convert DOC files, it always fails
when I try. The error message says there is problem locating font
TimesNewRoman.E24

I then open the ###TEMP.RTF file with a text editor and change the
Times New Roman font entries to Life or another font and I am able
to open this file.

I'm using Papyrus 8.23A English version

Regards,

Peter

Me three, or however that goes. That program is just what I need, right
now, and would appreciate a copy. Someone sent me a powerpoint file that
would be better as a text file, on a technical topic, and I would like to
see what is in there.

Thanks in advance, address is below.

Jim

Hi Jim,

I will send you the program but it only extracts the graphics and WAV
files.

However, I did write a script for TUC (The Ultimate Converter) that converts
most of the text into an RTF file which will load into Papyrus and then needs
quite a bit of work to remove the garbage that I am not able to identify.

I will mail both the program and the TUC script. If you can't find a copy of
TUC let me know and I will send that as well.

Regards,

Peter

I have now done this and the program can be downloaded from:

http://www.peterslegg.scubadivers.co.uk/atari.htm

If anyone would like to add any features to the program then I can
also make the source code available.

Regards,

Peter

Hi,

I have a Hades 060, and I work mainly with MiNT+N.AES.
I recently discovered that the AES calls appl_tplay()
and appl_trecord() are working under plain TOS. It
means that you can record events, and you can replay
them under TOS. It is useful to make demos of programs.

Unfortunately, I also discovered that these system
calls are not working on recent AESes (on the Hades at
least). It means that a recorded sequence cannot be
replayed under those AESes. These faulty AESes are
all derived from MultiTOS, and all faulty. Therefore,
MultiTOS, N.AES, Geneva have bad implementation of
those system calls. On those systems, the mouse begins
to move, as if all was right, and then it crashes the
Hades. The only solution is to turn the power off.

Not many people use those AES calls for ATARI programs.
I'm even wondering if I am the only developer for it.
Would you already experienced this problem ?

All replies will be welcomed ...

Best regards,

I recall discovering those two calls to be broken(*) under one of my
STFM TOS'es also.

(*)
Either didn't work at all or only unacceptable circumstances. Sorry too
long ago. I do recall deciding to forget about trying to use them.

Well, these system calls usually work fine. For instance, it
works very well on all various versions of MagiC (Mac, PC, ATARI).
It even works nice under ARAnyM, with TOS and MagiC. But, for
instance, it doesn't work under ARAnyM with N.AES installed
(I haven't recently tried Geneva or XaAES).

That's very strange ... That's why I say that the recent AESes
derived from MultiTOS (MultiTOS, Geneva, N.AES) are faulty.
I've put it on evidence with my Hades 060, and with ARAnyM.
As nobody use this system calls, except me, I'm very embarrassed.

Maybe I could try XaAES, but it has other problems of compatibility ...
I also tried with STonX, TOSbox, STEmulator or TOS2WIN, but this is
rather a problem of compatibility with these emulators. The only
emulator that works is ARAnyM (except from MagiC).

Thanks for your help !

Best regards,

Yes, and trusting my experience, it's badly implemented since
MultiTOS.

> (I'm just curious [I've never used those two AES calls] and I use a TT
> [TOS 3.05] for my GEM programming)

It works nice under plain TOS (on my Hades 060 it is TOS 3.06M).

> The funcs are defined to record and play back events

That's right. But you don't really need a large buffer. I put
16ko by default in my RECORD.ACC, but it can be enlarged by the
user.

> (Apologies for my deviation from the original question)

You don't need to be sorry. These AES system calls are very
badly documented. For instance the integer value "speed" in
appl_tplay(buffer, count, speed); is not documented at all.
4 seems to be a correct value, that plays event at 1/1 speed.
But it may be different depending on the AES ... That's
really tricky ! Trust me ...

They seem to be adequately documented in "COMPUTE's Technical Reference
Guide ATARI ST VOLUME 2 AES" as well as in the Lattice C manuals.
The former does state that the functions currently (printing date is
1987) don't work, though.

>appl_tplay( buffer, count, speed ); is not documented at all.

It's documented in both of the above.

>4 seems to be a correct value, that plays event at 1/1 speed.

The number is (according to the references above) supposed to be
a percentage of normal speed. That is, 100 should be normal speed,
50 half speed, 200 double speed, etc.

I've some documentation :
An old Lattice C document,
DDFS,
Compendium,
PURE C doc.
But I didn't found anything precise about these system calls.

>>appl_tplay(buffer, count, speed); is not documented at all.

That's completely wrong. These docs have been written by guys
that didn't know anything and that never tested what they wrote.
I say 1/1 speed should be around 4 or 5.
It works like this with MagiC (ATARI, PC, MAC), TOS, ARAnyM ...
As far as I tested. It's a shame to write things like that !

Regards,

>But I didn't found anything precise about these system calls.

What's missing?

The following is a condensed form of what the Lattice C manual says:

```
typedef struct {
  long ap_event;
  long ap_value;
} EVNTREC;

// Play back user's actions
int appl_tplay(const EVNTREC *mem, int num, int scale)

// Record user's actions
int appl_trecord(EVNTREC *mem, int num)
```

ap_event	ap_value
0 - timer event	elapsed time in system ticks (1/200 s)
1 - button event	low word button state (1 down), high word clicks
2 - mouse event	low word x coordinate, high word y coordinate
3 - keyboard event	low word key code, high word shift key state

scale is a speed percentage from 1 to 10000.

appl_tplay always returns 1.
appl_trecord returns number of recorded events. Normally equal to

the number requested.

Note also that the functions are supposed to (according to these
references) record user actions as above. They are not supposed to
record any other kinds of AES messages.
I assume the 'timer event' in there is not an actual timer event,
but rather a time marker to enable the playback at normal speed
(the occurence of a timer event is obviously not a user action).

>> The number is (according to the references above) supposed to be
>> a percentage of normal speed. That is, 100 should be normal speed,
>> 50 half speed, 200 double speed, etc.
>
>That's completely wrong. These docs have been written by guys
>that didn't know anything and that never tested what they wrote.

Well, since they are pretty definite, I'd guess they were going by
some documents from Atari. It's not Compute's fault if Atari decided
to do something different once they got around to implementing the
functionality. ;-)

>I say 1/1 speed should be around 4 or 5.

Strange that they would want to do such a change.
The 200 clicks per second from the 'timer event' should have been
easy to handle.

>It works like this with MagiC (ATARI, PC, MAC), TOS, ARAnyM ...
>As far as I tested. It's a shame to write things like that !

See above.

Anyway, this functionality was badly thought out in the first place,
IMO. I'm not surprised that the multitasking AESes have avoided
implementing this function.
Since what's recorded is not (according to the above) actual effects
of user actions, but the actions themselves, replaying them will only
work as expected if the screen contents are exactly the same as when
they were recorded. And if the user does not touch the mouse or the
keyboard at the same time. Kind of useless.

The Compute book claims the ap_event field is a short, which seems
to make more sense.
It agrees with the Lattice C manuals regarding the rest, though.

Just a short note here.
There is actually no legal way to tell the VDI to move the mouse
pointer. I'm not sure what the normal AES does, but Atari, as well
as the MagiC folks, obviously had special knowledge of the inner
workings of their various OS components.
Geneva, N.AES, XaAES etc do not have that luxury.

And of course, whatever special means the Atari and MagiC AESes made
use of is likely to fail when the VDI is replaced...

So, please have a look at my software Eureka :

http://eureka.atari.org/eurka304.zip

and test the RECORD.ACC accessory within it. You will see what
can be done with this very useful call. You can try under TOS
on every ATARI (I tested on 1040STf, MEGA STE 4, Falcon, TT,
Hades 060) under MagiC (every kind) or ARAnyM (TOS or MagiC).
It's much better than to dream reading a documentation, even
if it's made by ATARI Corps (bless them ...).

Good try ! And, keep it fun !

There will (most likely) be with fVDI once I get around to writing the
mouse handling code (probably not long now). Currently, fVDI relies on
the original VDI (or whatever other VDI was loaded before fVDI) to
handle the mouse and keyboard, and only makes use of the vex_ vectors
provided by that one.

And then there's the upcoming work to make the ARAnyM driver capable
of using a real (as in controlled by X, Windows, or whatever the host
graphics system is) mouse pointer, which will make even stuff like mouse
accelerators fail (since the VDI will no longer be in control of the
real mouse position at all).

Since NVDI appears to use the lineA variables in the same way as the
original VDI, it may not have a problem. Indeed, I would have
expected them to make sure stuff like this worked. Still, that doesn't
change the fact that the AES must resort to undocumented methods.

Of course, I could easily add a function for moving the mouse pointer
to fVDI, which could then be used by XaAES. ;-)

Looks like a nice program, though not something I have a use for.

>and test the RECORD.ACC accessory within it. You will see what
>can be done with this very useful call. You can try under TOS

If the circumstances are right, and the user cooperates, it can of course be used (assuming the OS supports it).

I have actually even used it myself, in MGIF. The usage there was precisely because I needed to move the mouse (not the displayed pointer, since this was for full screen image display) to be able to scroll a displayed image indefinitely using the mouse, and the VDI didn't support that.
I guess I will have to update MGIF once I do the changes to fVDI that I mentioned elsewhere. ;-)
Incidentally, the MGIF code has a special option to turn this feature off since it is not compatible with all machines. Back then, there was apparently a problem with Warp9 according to the MGIF documentation.

>It's much better than to dream reading a documentation, even
>if it's made by ATARI Corps (bless them ...).

Using undocumented behaviour is seldom a good idea.
If it's not documented, you should expect it to change at any time.
If it appears to be documented wrongly, it may be that it's the implementation that is wrong, and that may be fixed at some point. ;-)

> implemented, though.

Yes, it's appealing as explanation. But it doesn't have anything
to do with the reality of what it does. It even doesn't give any
order of the range of values you can use ...

>>It's not implemented in XaAES, but it implemented in N.AES and
>>Geneva, at least. But it's wrong.
>
> In what way is it wrong? Or do you just mean that it does not work?

Well, it's partly working as I said before ...
If you have recorded a sequence on a correct configuration. This
is the case of the "EUREKA.REC" sequence that is included in the
archive of my software (Eur⍰ka). Then when you try to replay it.

On XaAES, it completely skip it. When you start replay, it stops
immediately.

On N.AES, the mouse begins to move, but it stops 1 second later
with the ATARI freezed by a big bug ... You just have to turn the
power down.

On Geneva, it move very slooooooooooow ! The ATARI can't be rebooted
with <C-A-D>, because the computer is totally under control of a
slooooooooow turtle. I tried to change the "scale" factor of
appl_tplay(), but it has no effect ...

So, it seems that it could work, but it doesn't. That's why I
say that it is implemented, but badly implemented. That's all.

> I have actually even used it myself, in MGIF. The usage there was
> precisely because I needed to move the mouse (not the displayed
> pointer, since this was for full screen image display) to be able to
> scroll a displayed image indefinitely using the mouse, and the VDI
> didn't support that.

Ho, yes, I hadn't noticed that. For my soft, I don't generate
events, as you seems to do. I only record events in a big buffer
(16kb is quite enough), and then saving it as is in a *.REC file.
Then, I read the buffer with appl_tplay() every time I want.
It's a sort of mechanical piano that replays always the exact
same partition. I use it as a tool for making demos of Eureka.

> I guess I will have to update MGIF once I do the changes to fVDI that
> I mentioned elsewhere. ;-)

So, you will ? That's great !

>>It's much better than to dream reading a documentation, even
>>if it's made by ATARI Corps (bless them ...).
>

> If it appears to be documented wrongly, it may be that it's the
> implementation that is wrong, and that may be fixed at some point. ;-)

You're right. But keep in mind that it works the same way on
a great quantity of ATARI machines. You must respect that. And
ATARI TOS/AES/VDI are the references. As it works, not as it should
in a bad "documentation".

I told you about the DDFS documentation. It's french. It has been
made officially by ATARI France for the Falcon 030 developers. It's
the last official reference. There's nothing clear about these
system calls. Besides of that, it works also on a Falcon, as it works
on other platforms.

There's nothing to invent in this domain ...

Right. Bye for now ...

Regards,

CONFERENCE ON SOFTWARE PATENTS

<http://www.europe-shareware.org/pages/communiques/
030428_conf_parlement.us.pdf>

Europe Shareware invites shareware authors and companies to take part next May 7th & 8th in the parliamentary debates on software patents.

M⍰reau, 28/04/2003. During the current parliamentary work on the COM(2002)92 directive concerning software patents, two conferences will take place in May in Brussels.

On May 7th, a conference organized by Eurolinux, in which Europe Shareware is an active member, will be held at the Dorint Hotel in Brussels with many workshops including Members of the European Parliament (MEP), experts and CEOs. Special guests include Professor Lawrence Lessig from Stanford University, Professor Brian Kahin from Michigan University, Richard Stallman and the Eurolinux experts in computer science, economy and law.

On May 8th, the MEPs will organize a hearing for software SMEs in the European Parliament. On the suggestion of Europe Shareware, H⍰kon Wium Lie from Opera ASA and Thorsten Lemke from Lemke Software GmbH have been invited to represent the shareware sector ; thus making shareware companies one third of the panel.

We encourage shareware market players to contact us to register for these events, so that the legislators take into account the impact of software patentability on shareware in the final directive text.

Programme of the May 7th & 8th debates :
<http://swpat.ffii.org/events/2003/europarl/05/>

The directive text :
<http://www.europa.eu.int/comm/internal_market/en/indprop/com02-92en.pdf>

Hi Roy,

By "pictures" I assume you mean the embedded, vector art type drawings.
The PPT files I was working on had about 100 slides but only about 2
such drawings.

I think these pictures have the same format as those in Word documents
but I don't know any more than that.

Regards,

Peter

Hello.

What is the corret Opcode from the XBIOS function VsetMask.

I have found two numbers:
0x5C (92) in the os_calls.pdf from Miachel Schwingen and Compendium, in all
other docs is 0x96 (150).

Another layer of confusion to be added--which version of the Compendium do
you have? I think I have the second printing.

The errata for the first printing has a correction to a page 4.106. The
latest version does not have a page 4.106.

On page 4.100, Vsetmask is 0x96 (150)

The definitive answer might be found in a .h file in your gcc library.
This is where VsetMask is given a numeric value. Try grep. Or, for that
matter, grep/find/which .h files in any compiler that has that function
call available.

Jim

Mmh, then is Michael Schwingens os_call.pdf wrong.

I am looking for a good C compiler for the ST, any recomendations?
Also TOS calls information sources that are accurate.
Any ideas?

Pure C or Lattice C - commercial
Sozobon - free
GCC - free (but requires lots of memory)

TOS calls information is avialible on the internet, try searching on Google.

I was trying to compile some code that uses MT_AES lib, the .H file
from this lib has lines like these ones:

```
#define  appl_init() \

             MT_appl_init( 0L )

#define  appl_read( a, b, c ) \

             MT_appl_read( a, b, c, 0L )
```

when i try to compile i got errors in this kind of lines with the "\"
char to join to different lines in one. In the Pure C help is said
that is possible to do it.

Any idea what could be wrong?

Thanks

Right! It is working well, with Pure C 1.1 Dec 18, 1992

>Any idea what could be wrong?

Do you have the above version?

        Jens

```

You seem to have an extra empty line between \ and MT_appl_*. Try this instead:

```
#define  appl_init() \
             MT_appl_init( 0L )

#define  appl_read( a, b, c ) \
             MT_appl_read( a, b, c, 0L )
```

If you absolutely want the extra line, you have to add a "\" on that as well, like this:

```
#define  appl_init() \
             \
             MT_appl_init( 0L )

#define  appl_read( a, b, c ) \
                              \
             MT_appl_read( a, b, c, 0L )
```

Must be that.....I think i have an earlier version but i cant tell you
for sure because i?m at work now, tonight i will take a look.

Thank you.

I recently had problems with this. Be sure the end of line is in Atari
format versus unix format. You can alter this using the free QED editor,
(File -> Info)

Thanks
Mark

yes....when i removed the extra line it worked.
It's extrange because I have extra lines trough all my MT_AES include file.

Thanks

I took a look....it is in Atari format....the problem came because
there is an extra white line between every two lines throug all the
mt_aes.h (i have no idea why).
Well i dont know if is clear what i mean....my english is limited. :-)

I read in Atari-Source that you have used Pure C for coding your AOL
client. Did
you use it whith multitasking OS? If yes....what shell or app did you
use to
edit the sources?....the Pure C original one is not very multitasking
friendly.

Hi group,

Please visit
http://arnaud.bercegeay.free.fr/gemlib/

Download my small test software (sources are included)
http://arnaud.bercegeay.free.fr/gemlib/vqdevinf.zip

and run it. This will perform the VDI 248 call (vq[t]devinfo) on your
system, and write back a report file (VQDEVINF.TXT).

Please send me back your report file (VQDEVINF.TXT), with the name and the
version of the GDOS you use (NVDI, SpeedoGDOS...).

best regards,
Arnaud.

Can you please try the next release of my test program :
http://arnaud.bercegeay.free.fr/gemlib/vqdevinf2.zip

For other:
if my test program crashes on your computer, please download this last
release and try it again. If this works, please tell me that the 1st
release crashes on your system.

For information, the fix is the way the VDI248 call is performed (sources
are still included in the ZIP file).

best regards,
Arnaud.

I'm searching for an ST program that can read data from the parallel port
and act exactly as a printer. I would like to capture printouts from an
old computer with no other interfaces to salvage some source code.

The alternative is to print on paper and then use a scanner and OCR but
it takes a lot of time and some OCR errors might ruin the sources.

It should be possible to read the printer port but what about
manipulating the (crossed) strobe/busy lines?

Does anyone knows of such a "printer emulator" program and where to
download it?

If not, I might even try to write one myself. It is possible to read the
printer port but I'm uncertain if it will work to simulate the
strobe/busy handshaking by manipulating the sound chip registers.

I tried this a long time ago and managed to read the first byte in GFA
but never got the other computer to send any more data. Maybe all that is
needed is a small ASM routine to toggle the handshaking so the built in
routine can read the next byte?

If anyone knows of a similair solution for PC I can use that as an
alternative. Perhaps even better as this eliminates the risk to blow the
Atari printer port...

Sounds like a rather round about way to save some files. But if I was to
make a suggestion, I'd setup the machine for a serial printer. I've never

dealt with the parallel port, but the serial port I've done alot with.
Maybe a cpx or some old desk acc from Atari would let you set the
port for sending stuff to a printer. It's an idea anyway.

This computer has two ways of sending data:

1. Parallel port in ASCII format.

2. 300 baud analog suitable to record on a cassette tape.

So, I prefer the first method...

This definitely is possible. PARCP uses the printer port for transfers
and so does the Portfolio and STBook data transfer utilities.

I don't need any high transfer speeds, only error free.

I have found some hints on Google about how it might be done.

To my surprise a search for a PC program capable of this returned
nothing...

There might also be a possibility to use a parallel to serial converter
but I guess those are both hard to find and expensive.

Hello

Can you please try the next release of my test program :
http://arnaud.bercegeay.free.fr/gemlib/vqdevinf2.zip

Done and trouble is the same : after I got a normal window with lots of
writings in it the computer reset.
I thing the trouble only come when the programm tries to write a file.

My config : H60 with caches off (for tests), et6000, nova vdi 2,61 and
everythings running on the ramdisk.

Regards

Trying to avoid a flame here, but can someone email this to me, or is that a
no-no?

Don't know the status of Atari software these days, so I am not sure if this
is legit

Thanks

Well I use GFA-Basic so I cannot suggest any 'C' lib's.
Perhaps someone into 'C' could jump in here and give you some pointers.

The RCS called 'Interface' is pretty good. If you surf around this site
you can find it. I could not get the exact url as it uses frames and
javascript. :-P I use this one myself.

http://www.hadley.de/frameset.htm

You can download Atari's RCS program here:
http://www.q1.net/~atari/html/gfa_apps.htm

Yesterday I had time to check it and found out that my EdDi 1.20 is
installed by NVDI 5.03 as part of the runup of nvdi.prg.

If you would be interested in joining in a small GEM programming competition
this holiday season, send me an email at my netset account. If there is
enough interest I'll finalize everything up next week via email.

Entries would be a small GEM Toy or Game with a seasonal theme.

No cash or Prizes, just programming for the glory and fun.

Please drop by http://gemcandy.atari-users.net and vote in the poll as well
;)

Hello Atari users,

I made 3 simple programs using system functions to access the video
hardware: AES, VDI and XBIOS:
http://membres.lycos.fr/pmandin/download/video7.zip (157Kb).

Bugfixes in Milan MVDI support (vixb.ttp): Please test and report.

Hello Atari users,

I made 3 simple programs using system functions to access the video
hardware: AES, VDI and XBIOS:
http://membres.lycos.fr/pmandin/download/video8.zip (160 Kb).

VDI/AES:
- Restore/save palette even in True Colour modes.

XBIOS:
- Bugfixes in Milan MVDI support.
- Added preliminary support for Videl Inside (Falcon).

Sources are available:
http://membres.lycos.fr/pmandin/download/src/cleancode-0.8.tar.gz (90 Kb).

A guy at work was showing me the peer-to-peer file sharing
systems on the peecee and I wondered if there was any open-source
software that might be ported to Mint or had all ready been ported.

I found this:

  http://sourceforge.net/project/showfiles.php?group_id=4467

which is GTK Gnutella. One of the source code files is listed
as platform independant. I think this might be related to Gaim
and the other GTK+ stuff that Piku mentions on Atari-source.com

I don't do much Atari development and I use Pascal so I am not
much use. Would this be portable to Mint or does it rely on too much
underlying software ?

Peter

Peter,

This kind of thing falls under the project that I am undertaking. Porting gdk/gtk to atari. Once this is done, any gtk application including gtk-gnutella will compile right over, though it's likely to consume excessive amounts of ram and run very slowly. It might be easier to port the underlying source and add an AES interface to it though I don't know much about this either. Still for now my work on porting gdk is going nowhere as my falcon simply doesn't have enough ram to compile stuff. Though in my head I just figured out an interim solution - Aranym.

woo hoo.

Thanks
Mark ;-)

Hello Atari users,

I made 3 simple programs using system functions to access the video hardware: AES, VDI and XBIOS:
http://membres.lycos.fr/pmandin/download/video9.zip (161 Kb).

XBIOS:
- Added preliminary support for BlowUp (Falcon).

If you have one of these screen enhancers, please report and test:
- Milan with Milan MVDI driver.
- Falcon with CentScreen 3 (CT2), Videl Inside, BlowUp.

Sources are available (92 Kb):
http://membres.lycos.fr/pmandin/download/src/cleancode-0.9.tar.gz

Well 6 people have stated in the Poll that they would participate.
But so far no one has sent me any email.

So we will make this a short one.

Rules for entries.

It runs in GEM in any resolution.
It has a holiday or seasonal theme.
It can be a game or toy.

Entries information should be emailed to me by the 24th of December
(Eastern Standard Time - United States of America).

I will put the information up on GEM Candy on December 25th.

Voting will start then and finish on January 6th.

Prizes:

There will be small graphics for websites for 1st, 2nd, 3rd, Participation
The thrill of competition.
The publicity for your self or your crew.
The encouragement to me to organize more of these things.

For more information email or go to
http://gemcandy.atari-users.net/

Please forward this/translate to other languages

I downloaded gtk-gnutella-0.91.1 last night and tried it on cygwin.
The 'configure' output is reproduced below. It may help a MiNT guru

decide if the port would be feasible. Personally I think that it is and that if you've the relevent compilation tools upon your MiNT system then you'd be able to compile it yourself. The GTK/GLIB version is the only obvious caveat.

I did consider trying a cross-build but unfortunately haven't a clue about rpm's - specifically there's a leading '/' in the GTK file list and no way do I want that lot stomping into the root of my cygwin! Suggestions on how to extract "safely" welcome.

Guy,

Note that there is already a gtk 1 port to win32 as well as most of hte other supporting libs. This is the kind of work that has yet to be done for the Atari. Gdk must adopt VDI calls in order to work on the atari which is not really much more than tedious work. I haven't enough ram on my system to even attempt to compile glib (which is needed by gtk) so I haven't bothered to try porting yet.

Mark

>other supporting libs. This is the kind of work that has yet to be done
>for the Atari. Gdk must adopt VDI calls in order to work on the atari
>which is not really much more than tedious work. I haven't enough ram on
>my system to even attempt to compile glib (which is needed by gtk) so I
>haven't bothered to try porting yet.

I located...
glib-1.2.8-1.m68kmint.rpm
glib-1.2.8-1.src.rpm
gtk+-1.2.8-2.m68kmint.rpm
gtk+-1.2.8-2.src.rpm
...on the sparemint site. These were what I was going to cross-compile
against until I hit the rpm worry mentioned above. FreshMeat reveals
'alien' which hopefully can turn them into viable tgz files but life
is never simple because now I'm wrestling with 'alien' build problems.

The Gnutella I compiled isn't a win32 one btw. Virtually all my cygwin
stuff targets "unix/X". Therefore all I really need is the 1.2.8
headers - I'll hack away the gnutella 'configure' version check and
see how much it moans. Linking isn't so important because I've no MiNT
system and associated X upon which to try it.

Okay, I got alien vaguely working and extracted the glib/gtk stuff.
Couldn't cross-configure it so instead let it configure natively then
hacked the two Makefiles accordingly - may not be an issue on a native
MiNT system (I've not looked in the configure script).

```
     ...[gtk-gnutella-0.91.1]...

...that's it. It'll get to the link phase (needs zlib) abeit pointing
at my cygwin X headers but no other choice there! ;-)

Log output for future reference coming up... oo the bandwidth!
(m68-gcc is m68k-atari-mint-gcc.exe btw).

That's about the limit of what I can do here, except *possibly* produce a "gnutella lib" for someone else to link against.

Guy,

yes GTK can be directly compiled for Atari, but a true Atari port would use the VDI. Currently you have to start GEM, then start an X server and THEN run a GTK application. This whole ordeal will consume LOTS of ram. not to mention the X server for Atari isn't too fast. already you can run this application, but seriously, AES + GTK + gtk-gnutella + X will probably consume 14 megs of ram on a falcon and be terribly slow. This stuff is better for clone owners or CT60 owners to be. I wanted to port gtk to vdi to avoid the need for an x server and to make gtk programs smaller, more efficient and directly useable from a gem desktop.

Mark

How much ram did you have to get that to happen, or are you cross compiling?

..a huge posting that didn't mean much to me ;-)

Oh dear, what have I started. Being the one that started this
thread I must say I am impressed by your efforts. What is
cygwin ?

I've never done any C programming on the Atari or under Unix.
The nearest I came was developing a pile of C stuff for Oracle
databases and dce to access some legacy apps from Oracle and
vice versa. It was nearly all done on VMS. It was several thousand
lines of code in about two dozen modules but I still don't call
myself a C programmer. I cheat by thinking in Pascal and then
translating to C but C's idea of pointers and parameter passing "does
my head in".

I think I have enough memory on the Milan (144Mb :-) but I'm
a bit low on HD space to install a C development system. If
I ever get around to fitting a new HD I might look into it.

Are the Sparemint people interested in what your are doing
with these libraries ? Surely it will open up some more
possibilities.

Regards,

Peter

Cygwin is an environment that lets you take source code designed to run on
LINUX and run it on Windows. One side effect is that you can also run the
ATARI version of the GCC compiler on Windows....

Hi group :)

My dynamical library ME.LDG ("ME" means "Modular & Evolutive", formely
known as "PARX system") has just been released. Since release 1.00, the
ME.LDG archive contains sources and is under LGPL license.

http://perso.wanadoo.fr/arnaud.bercegeay/index_e.htm

ME.LDG is a lib to load, dither and display pictures, using M&E system
(RIM plugins to Read IMage). Seems to work fine on falcon, magicmac,
hades, aranym/fvdi...

RIRI2 (an image viewer) use ME.LDG, and is available on my web site.

Enjoy :)

It seems that there's no translation.

Any volunteer to translate the file from german to english ?
pleeeeeease... (the UDO file size is about 32kb)

Cross compiling with Frank's cygwin one, er...

```
Reading specs from /usr/lib/gcc-lib/m68k-atari-mint/2.95.3/specs
gcc version 2.95.3 20010315 (release)
```

...that one! ;-)

Ah, right. I knew it would be hefty but hadn't thought it would make
even a falcon struggle.

Any progress on that, or is it still at the head scratching phase?
I've compiled a lot of gtk stuff for cygwin, some hacking required as
well but never had to sit back and understand the big picture. Is the
low level stuff scattered all over or nicely grouped?

Me neither, I'm just the messenger! Nah, all it was, was a load of compiler compilation lines. The 'configure' phase decides what to compile and what the compiler options should be then generates one or more 'Makefile's. That was the 'make' output as it was compiled.

>Oh dear, what have I started. Being the one that started this
>thread I must say I am impressed by your efforts. What is
>cygwin ?

Unix on windows, http://www.cygwin.com if you're curious. The folks there have put loads of unix functionality into a DLL and compiled oodles of unix programs linked against this (cygwin1.dll). More folks keep coming along and adding more stuff. Almost the opposite of wine I guess.

>I ever get around to fitting a new HD I might look into it.

It does add up. C/C++ compilers do sprawl a bit - gcc especially stuffs a lot of information into generated files. Fortunately most of them can be deleted once the app is compiled to satisfaction and the executable itself can be stripped. You might even be able to compile yourself a pascal compiler!

>Are the Sparemint people interested in what your are doing
>with these libraries ? Surely it will open up some more
>possibilities.

Unfortunately I doubt it. Like Mark mentioned, limited machine resources have to be catered for. SDL looks an interesting development though.

Hello,

I'm looking for help from a 68040 programmer :

You probably know the programm XFERRATE.TTP this reliable tool gives the
bandwith for data transfer.

Some people tested the 68040/60 instruction move16 for ram data transfer
and we noticed it is 40% faster than 4xMove.l

I would like to know which speed we could reach if we used move16 in xferrate.

Unfortunatelly nobody wants to make the change. I would be happy to do
it but my knoweledges in assembler are basic. I can write some small
routines but am unable to understand a dissablembled programm.

Would it be someone that may help ?

Regards

Atari Hardware and Software
All of this was packed and put away 15 years ago. It is all clean and each device has its own
transformer and in most cases the original box and manual. The prices shown are expected
prices, other offers (no trades) will be entertained. Purchaser pays for shipping.

1) Atari 800 -- $180 (includes additional memory card)
    Like new but needs video chip to control display.
    Atari Memory Card (has a white 3 painted on it. Think it is a 16K board.)

2) Atari 400 -- $100
    Like new

3) Atari 810 Disk Drive -- $70
    Very clean and unaltered.

4) Atari 850 Interface Module -- $50
    Plus 300 Baud (Believe it!) direct connect modem

5) Atari 1050 Dual Disk Drive -- $80
    Very clean and unaltered.

6) Atari 410 Recorder -- $90 for Recorder & Tapes
    Antic (Monthly) Tapes (Total 18 tapes)
    Games and programs galore on each

7) Fastchip for 400/800 -- $70
    Atari System Manual
    Monkey Wrench Enhance Chips
    Star Raiders Cartridge
    Assembler Editor Cartridge
    Basic Cartridge

8) Atari Program Exchange Software -- $40
    Chameleon CRT Terminal Emulator
    Program-Text Editor
    Mathlib
    Deep Blue C Compiler
    MAC/65 (Assembler)
    DOSKey

Hi everyone,
last year I made a similar request for help and my thanks go to Pontus Skold who agreed to help and Roger Cain for his advice.

I now need help again, I have already used a disk editor to examine the software and was unable to locate the problem myself. The problem is with a STOS extension, after conversing with the author of the extension (with whom I have lost contact) I was informed that when I compile my programs the graphics extension checks for the TOS version before initialising where as the audio extension does not.
I believe that it is this TOS checking process that casues problems on my ST as both compiled programs using the audio extension only and non compiled programs function normally.

There is another difference between the graphics and audio extensions in that the graphics extension places data on even bounderies, this could also be the cause of the problem however I would have thought it would do that in both complied and non compiled states which is why I believe the TOS checker to be the cause of the problem.
All I need is for someone to find and remove this check, hopefully this is located in the compiler extension which is only 17K in size and so should not be too difficult or take long to do.

If anyone is interested in looking at this for me let me know.
I believe that the extension was written in assembler/machine code so you will need to have a program that can disassemble/reassesemble the file as I don't have one.
If it helps the error message displayed by the ST is "TOS error #82 press any key", when a key is pressed the message changes to "TOS error #32 press any key", further key presses redisplays the second error message

Thanks,
Stephen Moss

Atari Hardware and Software (List Revised 4 Dec 02)
All of this was packed and put away 15 years ago. It is all clean and each device has its own
transformer and in most cases the original box and manual. Devices were working at time of
storage. The prices shown are expected prices, other offers (no trades) will be entertained.
Purchaser pays for shipping. All hard/software is USA specific

1) Atari 800 (32K I think) -- $180
    Like new but needs video chip to control display.
    Plus Atari 16K Memory Card
    TV Switch

2) Atari 400 -- $100
    Looks like new
    Dual Game Controller
    Joy Stick
    TV Switch

3) Atari 810 Disk Drive -- $70
    Very clean in prime condition.

4) Atari 850 Interface Module -- $50
    Plus 300 Baud (Believe it!) Microconnections direct connect modem

5) Atari 1050 Dual Disk Drive -- $80
    Very clean, Primo condition.

6) Atari 410 Recorder -- $75
    Emaculate
    Antic (Monthly) Tapes (Total 18 tapes with descriptions)
    Games and programs galore on each

7) Cartridges and Chips -- $40
    Monkey Wrench Enhance Chips
    Fastchip for 400/800
    Star Raiders Cartridge
    Assembler Editor Cartridge + Manual
    Basic Cartridge + Manual

8) Third Party Software -- $70
    (APX-Atari Program Exchange Software unless noted)
    Mathlib for Deep Blue C
    Deep Blue C Compiler
    Deep Blue Secrets (Antic)
    Basic Utility Diskette
    Chameleon CRT Terminal Emulator
    Program-Text Editor
    KeyPad Controller v.2
    Creative Process (Antic)
    VT-100 Terminal Emulator (Antic)
    Print Tool [Atari Runoff] (Antic)

Envision (Antic)
MAC/65 Assembler (OSS)
DOSKey (Adventure Int'l)
Atari Softwar Protection Techniques (Alpha Systems)
Flight Simulator (SubLogic)
Dr. C. Wacko's Guide (with diskette)
PartyWare (HiTech Expressions)
S*P*A*C*E Disk Utilities Nos. 4, 10, 19, 27, 48/49, 52/53 SUPER STUFF!!
Horz/Vert Scrolling (Educational Software)
Basic Compiler (DataSoft Inc. - No Manual)
C/65 with OS/A+ (OSS - No Manual)

9) Manuals (Great Resources!) -- $25
Atari Operating System Hardware Manual with Listings
Advanced Programmin Techniques for Your Atari by Linda M Schreiber
De Re Atari A Guide (APX)
Mapping The Atari (Compute!)
Atari Basic Source Book (Compute!)
Atari Graphics (Compute!)
The Atari Assembler (Inman & Inman)
Comput!'s First Book of Pet/CBM
Compute!'s First Book of Atari
Compute!'s Second Book of Atari
Inside Atari Dos (Compute!)
OS/A+ (OSS)

Nope. I was being naughty and configured it "native" (for a cygwin/X
build) then changed CC etc in the Makefile's such that stuff I didn't
have installed for cross-m68k would still "see" a header. ;-)

The OP asked if a gnutella port would be feasible. Basically the
answer would be (I believe) "yes" for MiNT/X and "no" for a non-MiNT
target.

Hello,

I know that MonTT debugger supports two symbols formats.

The first is HED (Hisoft Extended Debug).
The second is DRI more common on Atari computer.

Which option can I use on GCC to generate HED or DRI symbols format into my program ?

Just out of curiousity does anyone have the Atari Ballerburg source code anymore?

The gem version in C?

About a decade ago it was available for a small fee.

Hello!

> Which option can I use on GCC to generate HED or DRI symbols format into my
> program ?

GCC don't support these symbol formats. You can use the source level
debugger gdb instead (compile your program with option -g to generate
debug informations).

Tschuess
...Frank

NNTP-Posting-Date: Tue, 10 Dec 2002 23:20:51 CET
Organization: Telia Internet
Xref: archiver1.google.com comp.sys.atari.programmer:1175

I am working on a GFA program written in "old style" but clean GEM and adding report printouts using NVDI.

On my home computer with NVDI 5 I can print several pages using this code:

```
h&=V_OPNWK(pr_vdi_nr&)
IF h&=0
  ~FORM_ALERT(1,"[3][GDOS saknas!][Avbryt]")
ELSE
  bildbredd%=INTOUT(0)
  bildhojd%=INTOUT(1)
  h_bak&=V~H
  V~H=h&
  CLIP 0,0,bildbredd%,bildhojd%
  '
  DO
    x%=0
    y%=0
    INC sidnr&
    klar!=@objlist_ritasida(bildbredd%,bildhojd%,ejxobj!,x%,y%,post&,sidnr&)
    stat&=V_UPDWK()
  LOOP UNTIL klar! OR stat&<>0
  '
  ~V_CLRWK()
  ~V_CLSWK()
  V~H=h_bak&
ENDIF
```

Sorry for the Swedish variable names etc but the procedure @objlist_ritasida does all the "painting" of a single page and the DO loop makes it print several pages.

With NVDI5 at home it works and all pages are correct but with NVDI4 on my job computer (yes, I really get paid for running this program!) page one is OK but when printing the next page the contents of page one is still present making a total mess.

On screen a simple CLS would fix this but how do I erase the content of previous pages using NVDI4 for printouts?

Also when using background printing with NVDI5 the "print queue application" is not ended after the printing is finished. And, if I start a second "printjob" I get new instances of the application. When the main program ends all ghost print queue apps disappears.

I guess I'm missing some calls to NVDI to make the background printing working properly?

According to the gfa manual, v_clrwk() is equivlent to clearing the screen
if used on a screen device, hense should do similar if used on a printer
device and would clear the buffer.

I've not used these on a pinter, so I can only refer to the manual.

You need to add a v_clrwk() inside the page printing loop - according to The
Atari Compendium, v_updwk() doesn't clear the workstation. Add it after you
v_updwk() call...

Oops, I should have read the manual. I'm the proud owner of a genuine GFA
3 (with 3.5 and compiler info) printed manual in my native Swedish
language. Quite a luxury these days when most computer litterature is in
English so I have no excuses...

However NVDI5 does clear the area without the v_clr() call which made me
(and my boss) a bit dissapointed when the NVDI4 setup at work did not
work. I have told him that Atari applications actually works compared to
Windows programs so it better be OK this time :-)

Who knows, mayby it will cure this problem as well...

Thanks to both of you who responded!

I just ask because the missing libintl.a that the linker complain in your
error report is in the gettext package. So just grab the libintl.a and
then you can successfully link I hope.

Hello Atari users,

Here are some new versions of my tests programs (104 Kb):
http://membres.lycos.fr/pmandin/download/cleancode-0.12.zip

The archive contains the latest version of:
- the PCIBIOS test program (I hope it works now).
- the video XBIOS test program (with NOVA support).

Sources are available (118 Kb):
http://membres.lycos.fr/pmandin/download/src/cleancode-0.12.tar.gz

Hi,

I have loaded a GIF picture with transparency in memory, with
'vr_transfer_bits' function from NVDI5, it's work like a charm. (
"T_TRANSPARENT" mode)

If I display the same picture with vro_cpyfm, the transparent pixel are in
white. :-/

So, my question is: How can I display this pixel transparent with the old
vro-cpyfm function?

Thx
Zorro

Which mode (vro_cpyfm(handle, mode, ...)) did you use? Using
S_OR_D should do the trick.

Ciao

Thomas

Hello,

I made a simple program to test the PCI bios:
http://membres.lycos.fr/pmandin/download/pci2.zip (49 Kb).
(bugfixes since previous version)

Tested on Had s60 : no change ; unable to install ....

Regards

 I'm working around one project and I need one copy of boot ROM loader
(TOS 0.98?).

 I want separate TOS in:

XBIOS
KERNEL
GEMDOS
AES
VDI
DESKTOP

The ROMs are 16KB or 32KB in size (I think).

I don't need image of system disk or complete TOS in ROM. Just image of
early ROM boot.

THANK TO ALL

You want to seperate TOS? What do you mean with this? You want the
single parts? Just take EmuTOS. You will get the whole sourcecode too.
No need for seperation of old TOS. It all had still been
reimplemented.

>The ROMs are 16KB or 32KB in size (I think).

I can not provide just a loader. But you could simply grab our free
EmuTOS, which also provides boot loading, like normal TOS does. And it
is totally free. Also the source is available. If interested, look at:

http://emutos.sourceforge.net

Hello Johan,

   JK> gcc on the other hand is a much better compiler, and
     > is free.

I would like to try that. Does it require MiNT or will it
run on TOS alone? I looked at the GNU web site, but didn't
spot any reference to Atari on there.

JK> It does take a lot longer (and more memory) to compile
> things, though, unless you run it as a cross-compiler
> on a PC or something.

I have a NetBSD machines that might be able to cross-compile for TOS. I'd need some way to tell gcc to build 68000 object code. Would I also need Atari-specific header files and/or libraries?

- Andy Ball.

Hi there,

Anyone here tried programming the ST to read from the cartridge port? I'm working on a sound sampler and would like to compare what I've been trying to some other code to see if theres a better way to do it. I'm using C (laser C & GST C) and havent found many library routines to read / write byte or word (16bit) values to ram (aka peek & poke in basic).

Hi, James!

JA> I'm using C (laser C & GST C) and havent found many library
JA> routines to read / write byte or word (16bit) values to ram (aka
JA> peek & poke in basic).

Well, with C you don't need peeks and pokes. Simply use pointers, let them point to the desired address and read out the values:

```
char  *bytePointer,
      byteValue;
short *wordPointer,
      wordValue;

bytePointer= <hex-coded address>;
wordPointer= <hex-coded address>;

byteValue= *bytePointer;
wordValue= *wordPointer;
```

These are absolute basics about C programming, you should read more about pointer arithmetics if you want to read out larger parts of RAM.

Always make sure that you have the rights to read from/write to the addresses you specify (see single/multitasking, memory protection, supervisor mode, ...)

Regards,

Alexander

Hmmm. I designed a video digitiser that plugged into the cartridge port back when I was at University - that was 7 years ago though, and my memory fades.
From memory, the cart port is mapped into memory at a range of addresses, and I simply mapped the digitiser's framebuffer address lines to make it visible at that address....

Then you just do:
unsigned char *myFramebuffer=(unsigned char*)START_ADDRESS_OF_CART_MEMORY;
and access myFrameBuffer as an array.

For your application, you could decode a subset of the cart address lines to give you register access to your sampler.

Craig.

Yes. As for any operating system you also will need this for TOS.

Please have a look on the sparemint crosscompiler page:

http://wh58-508.st.uni-magdeburg.de/sparemint/cross-mint.html

Hi Craig,

What I'd been experimenting with is somewhat similar, I'd actually fiddled with using a small ML routine inside a C function (as apposed to pointers). One oddity I'd run across was also in the hardware side, when the unit was plugged in, the ST wouldnt boot up fully. I checked on the board I'd layed out and found that it wasnt placing the magic longword used for either the diagnostic cart or a program cart (I'd referred to the atari internals book). But I want to take a look for some other methods that might work a bit better for what I'm trying.

ttyl,
James

Hi Alexander,

Right now I'm working on getting working in regular TOS, and will be adding neodesk / geneva compatibility as I can for multitasking compatibility. The Method I'd tried first, what I'd called "peek / poke" equivalent was a C function with some ML (Assembler) code to read the desired memory locations (the addresses assigned to the cart port in this case) and place it in a data register in the cpu then pass it into a C variable. I'll give the pointer another look as it may indeed be a bit easier.

ttyl,
James

<james-m-alexander@rogers.com> wrote:

>Hi there,

Various snippets attached. Environment was Mark Williams C. Probably
lacking some typedefs here and there. No speed optimisations - all
generic iirc.

>Anyone here tried programming the ST to read from the cartridge port? I'm
>working on a sound sampler and would like to compare what I've been trying to
>some other code to see if theres a better way to do it. I'm using C (laser C
>& GST C) and havent found many library routines to read / write byte or word
>(16bit) values to ram (aka peek & poke in basic).

In the first instance, hardware access with C is trivial. Just force a
specific value into a pointer of the right kind then dereference it.

```
typedef unsigned short uint16;   //whatever

uint16 * p =(uint16*)0x12345678UL;   //declare

uint16 value=*p;   //fetch word from $12345678
*p = value + 1;         //store value into $12345678

*p++ //above more efficiently
```

Similarly, if you wanted to access (say) 6 bytes at a time: provided
you have an Ansi compiler (as opposed to K&R structure handling)...

```
typedef unsigned long uint32;
typedef struct     {
uint32   hamster;
```

```
uint16   gerbils;
}    FOO;

FOO * pp = (FOO*)0x12345678UL;

if (cage_door_open)    {
     FOO cat_food = *pp;    //fetch six bytes from $12345678
}
```

In the second instance you need to be aware of processor architecture. Motorola is big-endian so if $12345678 had the value $ABCD in it then "*p" yields $AB in the high byte, $CD in the low byte...

```
*p >> 8       //$AB
*p & 0xff     //$CD
```

...nothing more needs to be said on this because the code ain't being ported.

Third instance. Memory protection. Given valid C statement X, it's perfectly possible for X to fail because of memory protection. Code running in supervisor state can access anything. The default user state code cannot. Peek/Poke typically enters and exits supervisor state for you. Often these Peek/Poke routines can be seen to fail if you're already in superstate. See attached code for ideas.

Fourth instance. Hardware being talked to. Most Atari compilers aren't too clever on optimisations so when you write "*p++" you'll probably get one read access followed by one write access. It isn't guaranteed though. Theoretically...

```
*p++;
*p++;
```

...might not do a read/increment/write twice over. It might get optimised to read-once/add-two/write-once. Aside from specific compiler options, the "volatile" keyword exists to help but ultimately for precise control you'll require assembler: you'd probably want to use assembler if (say) your attached hardware resets on a double-read within a given time-period but not on a double-read over a greater time period. Of course, if your attached hardware was this difficult to talk to you'd be in superstate disabling interrupts and so forth.

My guess is, as you've been happily using peek/poke, then assembler isn't required and "*p" will work just fine.

Finally, just to confirm what you've no doubt guessed by now, ram access is no different. Obviously if you are transferring one word at a time then the ram will need to be allocated on an even address - iirc Malloc() (as opposed to malloc which isn't required to but I don't know of an Atari one that doesn't so will be ok to use) will always yield even-aligned chunks. Assuming...

*ram_address++ = *cart_ip_address

...can keep up, then it's your ram buffering stategy which will be
key.

I faintly recollect that there were once products that worked in this way.
Maybe someone can supply the relevant addresses for any existing such
memory-mapped audio-in or audio-out devices, so that any new ones maybe
can be made compatible with some possibly existing software drivers/utilities?

Btw. a couple of days ago it came to my attention that I might build a
rather good audio player on the cartdidge port (i.e. the opposite of what
you do)- I found out that I could obtain for free a handful of quite good
12-bit D/A convertor chips... the only inconvenience is that they need a
clumsy +/-15V power supply.

> code. Would I also need Atari-specific header files and/or
> libraries?

I'm also use the m68k-mint-gcc cross compiler under NetBSD.

In order to compile something for the ATARI TOS you need:

- the cross compiler
- the cross binutils (linker, assembler and so on)
- the header files and libs for TOS/MiNT

You can compile the cross compiler itself (using the gcc sources and the
TOS/MiNT target patches) or I pack my setup into a tar file and you can
download it then.

Tschuess

Hi Djorje,

What got me started on this project was I needed something to record audio in

stereo at 16bit resolution at 44.1khz sample rate (for audio cd recording). On the hardware side I've designed up a "cartridge" of sorts using a TI A/D IC with a matching PLL timing IC to provide the clock rate. The stereo/momo mode selection and sample rates (32 / 44.1 / 48 Khz) are selected via the cart port address lines. Since I'm more experienced in electronics than programming, the software is taking me a bit longer to get going.

Hi!

I plan to build a small logging-utility that should protocol the uptime of the Atari (STBook) plus harddisc activity.

Thus I need to install a routine that does some checks each second (would be sufficient for my purposes). I want it to be a small tool without GUI "running" in background, so I don't like the idea of utilizing evnt_timer().

I know that with Xbtimer I can configure MFP-Timer A, but what if different programs want to use this as well?

Is there any standard/protocol on how to obtain this information? Is there any kind of 'locking' mechanism?

HTTP-links to helpful sites are welcome!

Regards,

Alexander

No details to hand (just about to go out) but the vertical blank

handler might be a possibility - you can even install a C routine if
it uses a standard stack-frame. There's a list of these VBL's
daisy-chained. Having done that you could use it to interrogate the
200Hz clock variable ('cos VBL frequency will obviously be dependant
on monitor) in order to get your one second trigger.

Hi, Derryck!

> Excuse me interfering, you mean "log" instead of "protocol" :-)

Well, you're right! That's a pitfall for germans, as there is a word "protokollieren" that just means "write down everything you notice".

Thanks,

Alexander

GH> it uses a standard stack-frame. There's a list of these VBL's
GH> daisy-chained. Having done that you could use it to interrogate the
GH> 200Hz clock variable ('cos VBL frequency will obviously be dependant
GH> on monitor) in order to get your one second trigger.

That's a good idea. I just figured out that Timer A cannot be configured for less than 50Hz, so there is not much CPU-time saved by utilizing it instead of the VBL, if any at all.

I'll check this out. Thanks!

Regards,

Alexander

Hi folks,
I am trying to read the inputs from an analog joystick connected to
the enhanced joystick ports on my Falcon. Does anyone know the
addresses where this information and how large is the data is (do I
need to Peek, Deek or Leek)?
Also are these addresses the same on the STE as they are on the
Falcon?

Thanks,
Stephen Moss

Hello,
Somebody has you it been successful to transfer since a program a URL to
CAB. I tests in vain with my program ICON Extract, I do not arrive
there. I use protocol CAB, but instead of opening my URL, CAB opens the

localhost systematically. The documentation is in German, I have some
difficulties for all of understanding. Thank you for your help.

Hi,

IIRC you should be able to transfer the URL to CAB via AV_STARTPROG.
Then the solution should not even be limited to CAB, but work on any
browser since the call is actually sent to the AV-SERVER.

Ideally, you might want to look in the environment for the string
"WWW_CLIENT=<path>" where the path to the browser should be stored.
Anyway, I am just writing this from memory, so I am not 100% sure it is
all correct.

Regards,

Joakim

I am currently using Lattice C 5.60 to write an update to a database engine of mine that I am using within another app.

However, I have come across a problem that is hard to solve.

In one module, I have defined some data buffers as

```
    Table __near dbtable[MAXTABLES];

    char __far dbbuffer[MAXTABLES][TABLEBUFFERSIZE];
```

In the main dbengine header file, I have the following lines (with unneeded stuff removed):

```
    typedef struct  {
        ...
    } Table;

    #define MAXTABLES    4
    #define TABLEBUFFE|RSIZE    (128<<10)

    // table definition buffer stored relative to A4 (in program
__MERGED section)
    extern Table __near dbtable[MAXTABLES];

    // database record buffer stored/accessed 32-bit absolute (at end
of BSS segment)
    extern char __far dbbuffer[MAXTABLES][TABLEBUFFERSIZE];
```

so that the size of dbbuffer would equal 512k (4 x 128k) Ive never needed more than four tables open concurrently, and most of the record/info buffers I've wanted in the past have needed to be in the 120-125k range for each table, so I chose 128k to simplify addressing (shift by 17, or a "swap halves, clear low half, add to self" sequence that Lattice seems to prefer when generating 68030 code)

When I compile the program module which contains only data definitions, the source module compiles OK, with no errors. If I disassemble it (using the supplied Lattice OMD app), the dbtable and dbbuffer objects are defined, exported, and of the correct size.

I then added them to a library file, which happens without errors.

When I then link the library into the application, it links OK, and reports no errors, but the generated executable has one big fault - the dbbuffer has not got any memory space (the BSS segment of the app does not increase by 512k as expected) As it's the last symbol in the far BSS segment, when I clear the buffer, it zeroes stack space, and causes the program to crash when it tries to return from whatever

program function called the memset(dbbuffer,0,sizeof(dbbuffer))
function.

The map file shows that the udata (far BSS) segment has a size of 512k
(80000 hex), buth the file with the dbbuffer symbol within it starts
at offset 512k within the far BSS segment (ie no size allocated, else
the far BSS would be 1 meg in size - 100000 hex)

If I comment out the definition in the library module, and define it
in a program module, and then compile and link as needed, it does
increase the BSS by 512k as expected. The map file showed the far BSS
is now 1 meg in size.

Has anyone else had a similar problem? (Global symbol within library
file not given any data/bss space in final app, but work as expected
when linked in from a non-library file)

Is there a fix I can use to get around this? (Or is it something
obvious that I just haven't tried?)

It's not the original, but the C source to a port of the XWindows version
exists
at the umich archive.

I forgot to mention that the dbbuffer symbol is referenced within the
dbCreateTable and dbOpenTable functions (it was not a case of a
non-refenced symbol not being linked in to the app, as could have been
inferred from the previous post) in code that looks like the
following:

```
    for( index = 1, tableptr = &dbtable[0]; index <= MAXTABLES;
index++, tableptr++ )  {
        if( tableptr -> inuse == 0 )  {
            memset( tableptr, 0, sizeof( *tableptr ) );

            tableptr -> inuse = 1;
            ...
            tableptr -> buffer = &dbbuffer[index - 1][0];
            memset( tableptr -> buffer, 0, sizeof( dbbuffer[0] ) );
            ...
            // nonzero return means "success"
            return index;
        }
    }

    // zero return means "failure"
    return 0;
```

Hello Atari users,

I made 2 simple programs using system functions to access the video
hardware. One uses the VDI, the other uses the XBIOS:
http://membres.lycos.fr/pmandin/download/video1.zip (98Kb).

I would like people to test them, specially if you have non standard video
hardware (VDI, clones, external video board, Blowup, ScreenBlaster,
etc...).

If you want to do a report, please give a maximum of infos about your
machine: (ROM, VDI, hardware extensions, cookies present, etc...).

I need documentation for this:
- MVDI (Milan VDI with XBIOS extensions). I have a simple doc, but there
is no info about how to detect if it is present or not.
- NOVA (Nova VDI with XBIOS extensions). I do not have any doc, if you
have it, send it to me.
- Blowup, ScreenBlaster, others screen enhancers: Send me docs.

The goal is to add support for these extensions in SDL.

Hello Paul,

I made 2 simple programs using system functions to access the video
hardware. One uses the VDI, the other uses the XBIOS:
http://membres.lycos.fr/pmandin/download/video1.zip (98Kb).

Ok j'irais voir, sorry : I'm gona lok at it.

If you want to do a report, please give a maximum of infos about your
machine: (ROM, VDI, hardware extensions, cookies present, etc...).

We made tests with Had s and Milan graphic cards : move16 is 40% faster than
4x Move.l.
Vq_trnfm is slow for ram<>ram transfers, a pure snail for ra<>graphic card ram
but 10 Mo/s for graphic card ram<>graphic card ram because it uses hard wired
routines.

I need documentation for this:
- MVDI (Milan VDI with XBIOS extensions). I have a simple doc, but there
is no info about how to detect if it is present or not.
- NOVA (Nova VDI with XBIOS extensions). I do not have any doc, if you
have it, send it to me.

After long searches I never found ani doc for the xbios(5) with graphic card and
Nova VDI.

If you would make DOOM using graphic card's ram as storage you could beat PC's
speed.

I'm ready to be your Had s bn ta tester.

Regards (yves.rogneATEfree fr)

Hello Atari users,

I made 3 simple programs using system functions to access the video
hardware; AES, VDI and XBIOS:
http://membres.lycos.fr/pmandin/download/video2.zip (151Kb).

The AES version does the same work as the VDI one, except it displays in
a window.

I added MVDI support to the XBIOS version. If you have a Milan, test it,
it should give you info about available video modes. I will make a more
complete test program the next time.
Warning: it may crash your machine.

Thanks to people that tested the previous programs.

Hey guys,

I was wondering if it is possible to somewhat easily use a static library compiled with gcc with purec. The concept makes it seem possible but in application I am not sure ;-) Thanks in advance for any help.

>    return 0;
```

Could well be a Lattice bug but can't be sure. I'm a bit rusty but iirc C has a notion of a "tentative definition" (or is it "tentative declaration"?). ie what's this?...

```
#include <whatever>
int x;   //outside func
int main(){}
```

...is it "extern int x" or is it "int x=0". Compiler assumes it's "extern int x" until something uses it, provided something else hasn't already done so in another compilation unit in which case it stays as "extern int" (and you get to use the "x" from the other compilation unit).

In other words compile the above and "x" won't appear. Add a second file...

```
extern int x;
void foo() {x=0;}
```

...and now "x" will appear (in main's code). What I'm not sure about is how clever C compilers are supposed to be. I've a suspicion they won't pick up on pointers to tentative declarations. You can test this simply by...

```
>
     dbbuffer[0][0]=0;  //or foo=dbbuffer[0][0]
>
>    for( index = 1, tableptr = &dbtable[0]; index <= MAXTABLES;
>index++, tableptr++ )  {
>        if( tableptr -> inuse == 0 )  {
>            memset( tableptr, 0, sizeof( *tableptr ) );
>
>            tableptr -> inuse = 1;
>            ...
>            tableptr -> buffer = &dbbuffer[index - 1][0];
>            memset( tableptr -> buffer, 0, sizeof( dbbuffer[0] ) );

>            return index;
```

```
>        }
>    }
```

...and, if I'm correct, try simply "dbbuffer[0][0]" - that alone may be enough to cause the compiler to reserve the space in the lib.

If it is a Lattice bug try wrapping the definition...

```
int foo=DONT_CARE;
char __far dbbuffer[MAXTABLES][TABLEBUFFERSIZE];
int bar=DONT_CARE;
```

...which might wake it up. ;-)

that. ;-)

>Thanks in advance for any help.

The object library format will be different. Obviously you'll be able
to get the gcc format but whether PureC is documented is another
matter. Even if you could you'd be looking at using a "standard" C
call (C++ won't work 'cos of name mangling 'though you could front-end
your C++ guts with an "extern C", I digress) in the hope both
compilers used the same registers. This may in fact be possible with
the atari else I'd have stopped waffling by now. Soo... assuming it
does then there's a possibility of cheating by adopting a similar
approach to DLL's - just have one function which returns the address
of the others inside the static lib. If the gcc static lib is gonna
have undefined references (say, it tried to use PureC stdio calls)
then forget it again.

All things considered, much easier to chuck the source at PureC!

<pmandin@caramail-nospam.com> a tapot$ avec ses petits doigts:

Hello Atari users,

I made 3 simple programs using system functions to access the video
hardware; AES, VDI and XBIOS:
http://membres.lycos.fr/pmandin/download/video3.zip (155Kb).

There are some bugfixes for the three programs.

The AES version does the same work as the VDI one, except it displays in
a window.

I added MVDI support to the XBIOS version. If you have a Milan, test it,
it should give you info about available video modes. I will make a more
complete test program the next time.
Warning: it may crash your machine.

Thanks to people that tested the previous programs.

To me, an "extern" global var means "defined elsewhere" and "I might
want to reference it in this file"

If I don't use extern it means "defined here", so two files with "int
name" would generate a linker error "duplicate symbol definition".

Similar would happen if both were "extern int name = 3;" - both files
would be defining a global var and giving it a default value

If only one file had "extern int name" and the other had "int name =
3" or simply "int name", then everything would be OK - it would link
correctly, and work properly. (in the second case, it would be in the
BSS segment, and set to zero by TOS when the program was loaded, but I
believe that C doesn't give any "set to zero" assurance for
uninitialised global or static local vars)

```

I tried changing the file where it was defined, and made dbbuffer a static global var, relinked the library, and then relinked the app with the new library, and the linker complained of an undefined var (and hadn't linked in the file from within the library where dbbuffer resided). Restoring dbbuffer to a regular global var quietened the linker down (no "undefined symbol" errors), but generated the same "linked in, but no space given to it" error as before.

```
> If it is a Lattice bug try wrapping the definition...
>
> int foo=DONT_CARE;
> char __far dbbuffer[MAXTABLES][TABLEBUFFERSIZE];

```

Thanks for the response.

I've always used something like

```
    typedef struct  {
        ...
    } Type;

    extern Type variable;
```

in my headers, and

```
    #include <header>

    Type variable;

    // or else "Type variable = 12;"
```

in one of my source files, and it always worked, but this was the first time it has failed.

I've never had problems with static-linked data buffers (up to a total of about 1.5MB) in previous apps, so I assume I've either hit a compiler/linker bug, or I'm just doing something wrong this time.

(I'd normally try to get the data buffers via "calloc(count,size)", but that has often failed in the past when the computer memory gets full, or I've got a few too many small calloc()'d items elsewhere in the program)

The dbengine.h file contained lines like:

```
    #include "0/types.h"        // "uchar8", "sint16", "uint32" and so
forth

    #define MAXTABLES    4
    #define TABLEBUFFERSIZE    (128<<10)

    #define makehandle(...)  { ... }

    typedef ... Handle;    // will fit into 32 bit unsigned int

    typedef struct  {
        uint32 inuse;    // its being used
        Handle client;    // client that is using this table
        Handle handle;    // this tables handle
        schar8 *buffer;    // data cache
    } Table;

    extern Table __near dbtable[MAXTABLES];
    extern schar8 __far dbbuffer[MAXTABLES][TABLEBUFFERSIZE];

    // I could possibly have included the buffer within the table
structure
```

and in a library module

```
    #include "0/types.h"
    #include "dbengine.h"

    // actual definition of the dbtable global var
    // referenced by CreateTable,OpenTable,ValidateTableHandle etc
    Table __near dbtable[MAXTABLES];
```

and in a different library module

```
    #include "0/types.h"
    #include "dbengine.h"

    // actual definition of the dbbuffer global var
    // referenced by the CreateTable,OpenTable etc
    schar8 __far dbbuffer[MAXTABLES][TABLEBUFFERSIZE];
```

and in a source file using those symbols

```
    #include "0/types.h"
    #include "dbengine.h"

    uint32 dbCreateTable( const uint32 clienthandle, const schar8
*filename )
    {
        uint32 index;
        Table *tableptr;
        uint32 handle;

        // validate client handle, filename, create file etc

        handle = 0;
        for( index = 1, tableptr = &dbtable[0], index <= MAXTABLES;
index++, tableptr++ )  {
            if( ! tableptr -> inuse )  {
                memset( tableptr, 0, sizeof( *tableptr ) );    // wipe
out any lingering junk
                tableptr -> inuse = 1;    // we're using it now
                tableptr -> buffer = &dbbuffer[index-1][0];    // give
the table an in-memory cache

                makehandle(handle, ..., a );

                // non-zero means success
                return handle;
            }
        }

        // zero means failure
        return handle;
    }
```

So, I'd assume the reference to the symbol name "dbbuffer" would've

told the compiler it is used, and would link in the file that dbbuffer was defined in.

I've asked the linker to generate a map file telling me all the global symbols the application has, and which file they were in, and their addresses.

In one block (called "udata") for 32-bit undefined global data the file with dbbuffer in it appears, and shows that the symbol was at offset 512k within the segment, and had size 512k. The total size of the udata segment was 512k (ERROR!!)

If I added

```
    #include "....dbbuffer.c"
```

to one of my source files, it would define the symbol, and wouldn't link the one from the library - and the "udata" size reported by the linker map file would be 1Meg - as I would expect.
Similar would happen if I linked the object file that defined the symbol.

The memory map for a lattice-compiled program is:

```
    Program header
    Code
    "Far" defined data
    "near" defined data
    "near" bss
    "far" bss
    (debug symbols - and/or relocation table)
```

The stack (default 4k, but can be increased by using a defined external var at compile-time) is usually placed (by the runtime startup code) after the end of the far BSS block and can/will destroy any relocation/debug data placed in RAM when the program is run.

"near" data is referenced via A4 register, (in a data segment called "MERGED" in the linker map file, IIRC) which the linker places somewhere within the near defined/bss block, as Lattice cannot generate a 32-bit offset from A4, so "near" data/bss is limited to a 16-bit offset (+/- 32k). The compiler can generate 32-bit relative offsets when generating 32-bit code for an 030 CPU - but not for "near" data.

"far" data/bss is referenced as 32-bit absolute, and has no size limit, AFAIK.

(Although from reading one of the Hisoft books some years ago, the Lattice object file format uses the top 8 bits of a 32-bit address [I cannot recall what]. It rejects any symbol above 16MB in size when compiling. I'd assume one object file was limited to 16MB of data/code - or is that for everything?)

Agreed.

>If I don't use extern it means "defined here", so two files with "int
>name" would generate a linker error "duplicate symbol definition".

I know for a fact this isn't the case *now* but not for when Lattice
was written. There's an easy test...

```
$ cat c.c d.c

#include <stdio.h>

int x;
void foo(void);
int
main()
{
 printf("main (x=%d)\n",x);
 foo();
 return 0;
}

#include <stdio.h>
int x;
void
foo(void)
{
 printf("foo (x=%d)\n",x);
}

$ gcc -Wall -ansi -pedantic -Werror -o c.exe c.c d.c
```

...will link. If Lattice moans then it either predates whenever this got clarified in the standard or has a bug. Your symbol table ought to look something like this...

```
$nm c.o d.o
c.o:
00000000 b .bss
00000000 d .data
00000000 N .stab
00000000 N .stabstr
00000000 t .text
00000000 t ___gnu_compiled_c
         U ___main
         U _foo
00000010 T _main
         U _printf
00000010 C _x
00000000 t gcc2_compiled.

d.o:
00000000 b .bss
00000000 d .data
00000000 N .stab
00000000 N .stabstr
00000000 t .text
00000000 t ___gnu_compiled_c
0000000c T _foo
         U _printf
00000000 C _x
00000000 t gcc2_compiled.
```

...rather than me muck up the explanation of "C" and "D", here's the relevent part of "info nm"...

```
    `C'
          The symbol is common.  Common symbols are uninitialized
data.
          When linking, multiple common symbols may appear with the
          same name.  If the symbol is defined anywhere, the common
          symbols are treated as undefined references.  For more
          details on common symbols, see the discussion of
-warn-common
          in *Note Linker options: (ld.info)Options.

    `D'
          The symbol is in the initialized data section.
```

You'd get "D" if you said "int x=VALUE" in one of the files, all the others would remain "C".

Tecchie bit: 'x' has "static duration" (as opposed to static scope), "file scope", and "external linkage". Due to the fact it is a static, then provided none of the translations units give it a value, the

compiler *must*, and will implicitly say "int x=0" at the end of one of the translation units.

>Similar would happen if both were "extern int name = 3;" - both files
>would be defining a global var and giving it a default value

That's illegal so it'll be a handy way of figuring out where Lattice figures in the equation. Compilers tend to accept it though with mixed results (usually bad) because it's more a linker issue than a compiler one.

>If only one file had "extern int name" and the other had "int name =
>3" or simply "int name", then everything would be OK - it would link
>correctly, and work properly. (in the second case, it would be in the
>BSS segment, and set to zero by TOS when the program was loaded, but I
>believe that C doesn't give any "set to zero" assurance for

All uninitialised static's will be zero. For the reasons stated above (though it may not be readily apparent) ditto globals - because every global actually manifests itself as a static somewhere iyswim! ;=)

```

>        uint32 inuse;    // its being used
>        Handle client;    // client that is using this table
>        Handle handle;    // this tables handle
>        schar8 *buffer;    // data cache
>    } Table;
>
>    extern Table __near dbtable[MAXTABLES];
>    extern schar8 __far dbbuffer[MAXTABLES][TABLEBUFFERSIZE];
```

Ah!

Add a macro to your project. Define only when compiling your lib...

```
#ifdef LIB_COMPILE
  Table __near dbtable[MAXTABLES];
  schar8 __far dbbuffer[MAXTABLES][TABLEBUFFERSIZE];
#else
 extern Table __near dbtable[MAXTABLES];
 extern schar8 __far dbbuffer[MAXTABLES][TABLEBUFFERSIZE];
#endif
```

...any scheme that does similar will do. EG:

```
#ifndef DBENGINE_H
#define DBENGINE_H DBENGINE_H

#ifndef LIB_EXTERN
# define LIB_EXTERN extern
#endif

//yer stuff
LIB_EXTERN Table __near dbtable[MAXTABLES];
LIB_EXTERN schar8 __far dbbuffer[MAXTABLES][TABLEBUFFERSIZE];
//yer stuff
#endif /* DBENGINE_H */
```

...then just "-DLIB_EXTERN" in the project that builds the lib.

```
>    // I could possibly have included the buffer within the table
>structure
>
>and in a library module
>
>    #include "0/types.h"
```

```
>    #include "dbengine.h"
>
>    // actual definition of the dbtable global var
>    // referenced by CreateTable,OpenTable,ValidateTableHandle etc
>    Table __near dbtable[MAXTABLES];
>
>and in a different library module
>
>    #include "0/types.h"
>    #include "dbengine.h"
>
>    // actual definition of the dbbuffer global var
>    // referenced by the CreateTable,OpenTable etc
>    schar8 __far dbbuffer[MAXTABLES][TABLEBUFFERSIZE];
>
>and in a source file using those symbols
>
>    #include "0/types.h"
>    #include "dbengine.h"
>
>    uint32 dbCreateTable( const uint32 clienthandle, const schar8
>*filename )
>    {
>        uint32 index;
>        Table *tableptr;
>        uint32 handle;
>
>        // validate client handle, filename, create file etc
>
>        handle = 0;
>        for( index = 1, tableptr = &dbtable[0], index <= MAXTABLES;
>index++, tableptr++ )  {
>            if( ! tableptr -> inuse )  {
>                memset( tableptr, 0, sizeof( *tableptr ) );    // wipe
>out any lingering junk
>                tableptr -> inuse = 1;    // we're using it now
>                tableptr -> buffer = &dbbuffer[index-1][0];    // give
>the table an in-memory cache
>
>                makehandle(handle, ..., a );
>
>                // non-zero means success
>                return handle;
>            }
>        }
>
>        // zero means failure

>    }
>
>So, I'd assume the reference to the symbol name "dbbuffer" would've
>told the compiler it is used, and would link in the file that dbbuffer
>was defined in.
```

Atm we're having to look at it from two aspects teetering around "is lattice standards compliant in this respect". Hopefully it is then I can help more.

>I've asked the linker to generate a map file telling me all the global
>symbols the application has, and which file they were in, and their
>addresses.
>
>In one block (called "udata") for 32-bit undefined global data the
>file with dbbuffer in it appears, and shows that the symbol was at

>cannot recall what]. It rejects any symbol above 16MB in size when
>compiling. I'd assume one object file was limited to 16MB of
>data/code - or is that for everything?)

If it isn't compliant, if you can come up with an "idiot-proof"
lattice project I can try mine digging out. It must be somewhere!

Hello Atari users,

I made 3 simple programs using system functions to access the video
hardware: AES, VDI and XBIOS:
http://membres.lycos.fr/pmandin/download/video4.zip (156Kb).

There are some bugfixes for the three programs. AES and VDI test programs
can be run in whatever bpp (even monochrome), and whatever resolution.

Feedback still needed for these programs. Thanks.

Hi group,

I'm trying to compile doxygen for Atari.

http://www.doxygen.org

I use cross-gcc for cygwin from the sparemint web site. Here is the make
process: 4 library are built (libdoxygen.a, libdoxycfg.a, libqtools.a
and libpng.a). Then, theses 4 libs and an object file "main.o" are
linked to produce the executable.

the crash occurs in the final step (linking):
$ m68k-atari-mint-g++ -static -o ../bin/doxygen ../objects/main.o
-L../lib -ldoxygen -ldoxycfg -lqtools -lpng -lc
collect2: ld terminated with signal 11 (segmentation fault)

Maybe the "atari" linker cannot deal with "big" libraries (libdoxygen.a
size is near 6MBytes) ?

On the same machine, i compile doxygen natively without any problems.

Any idea ?

Hello Atari users,

I made 3 simple programs using system functions to access the video
hardware: AES, VDI and XBIOS:
http://membres.lycos.fr/pmandin/download/video5.zip (157Kb).

There are some bugfixes for the three programs. AES and VDI test programs
can be run in whatever bpp (even monochrome), and whatever resolution.
Output can now be redirected to a file (see doc in archive).

CentScreen (CT2) and Milan MVDI support are available in the XBIOS
program. Please test if you have them.

Feedback still needed for these programs. Thanks.

Sources available on my web site, in the cleancode-0.5.tar.gz archive.

Hello (atari) world :)

A new release of GSlib is available
http://perso.wanadoo.fr/arnaud.bercegeay/archives/gslib-0.4.0.zip

GSlib is a C library (built for sozobon, purec, gcc 2.81 and [cross]gcc
 >= 2.95) to manage gemscript protocol. Sources, user doc, developer
doc, GS protocol (translated by Peter West) and examples are included in
the package.

GSlib is a windom extension (see http://windom.free.fr).
btw, windom 1.20 has just been release yesterday :)

What's new:

- new internal design (more that just one big C file)
- add new type GSHANDLE, GScmdfn and GSACK_ANSWER.
- change some prototype: functions now use GSHANDLE, GScmdfn and GSACK_ANSWER in place of 'void' or 'int'.
- use Galloc() intead of Mxalloc() for global memory allocation.
- add utilities functions GSGetType(), GScount(), GSlength(), GSszzcpy(), GSstrncat(), GSstrcat(), GSstrcpy(), GSstrncpy(), GSGetNextString() and GSGetAppId(),
- GSGetNextCommandResult() is now defined as GSGetNextString().
- GSCmdInit() is now defined as GSstrcpy(), and so, the return value has changed, and that function has some bugs fixed.
- GSCmdAddString() is now defined as GSstrcat(), and so, the return value has changed, and that function has some bugs fixed.
- add support for hexa-encoding parameters (see functions GSHexEncode(), GSHexDecode() and GSHexLength())
- change release naming, now use "Major.minor.revision", and the release numbers are defined in the gslib.h header file.
- add documentation in source code, in doxygen format.
- the documentation is now generated using doxygen (a dirty-modified-by-me version which could export document in UDO format), and UDO.

Enjoy!
Arnaud

Hi Patrice,

I have a Falcon with CT2 but without CentScreen. I tried several
versions of CentScreen but never got it to work.
I ran your programs under TOS 4.04 in 256 color standard mode and the
color bars seem not okay.
The programs say that I have EdDi 1.20 installed. What is it ? Do all
Falcons have it or where did I get it ? Would be nice if all Falcons
had it, because then it would be very easy to check for pixelpacked
screen modes.

Gerhard

Hallo Gerhard,

The programs say that I have EdDi 1.20 installed. What is it ? Do all
Falcons have it or where did I get it ? Would be nice if all Falcons
had it, because then it would be very easy to check for pixelpacked
screen modes.

I only have the 1,10 can you tell me where to find the 1,20 please ?

As I said above I don't know what it is and I never intentionally
installed it. So I can't tell you where I got it. If somebody told
me what it is (and what parts belong to it) maybe I would be able
to tell you where I got it or at least take it from my machine and
mail it to you.

Good !

EDdi is usually for driving graphic cards or uncommon graphic modes.
I have a NOVA driver, a MENU, and a STA_VDI in my auto folder.
Probably one of them contain EDdi.

What kind of vid⍰o do you have ?

Regards

I see that I cannot create radio buttons, check boxes and some of the other
user interface elements so common today. Is there a way to do this with a
standard resource construction program, or are there custom libraries that I
can use to add these other user interface elements to my programs?

Actually you could with a great amount of work.

>Is there a way to do this with a
> standard resource construction program, or are there custom libraries that I
> can use to add these other user interface elements to my programs?

Yes, you can create dialogs and such with a resource contruction program
with those elements. However, there is one catch. If you don't mind modal
dialogs that block GEM activity while the user is interacting with your
dialog, then GEM itself provides such calls. If you want non-blocking
tasking freindly dialogs then you either have to code your own object
handler or adopt one of the many object libraries out there. You choices
on libraries might also be affected by the language you intend to code in.

I don't have a graphic card. Before I had the CT2 installed I have been using BlowUp but that's ancient. And I use NVDI 5.03. So no idea really where I got it.
And, BTW, still no idea what use to make of it. E.g. it would be nice if my program when VDI says 8 planes only had to check whether EdDi exists and says pixelpacked and otherwise would know that the screen format is interleaved. But it doesn't seem to really be that easy.

Hello everybody,

I am still working on my test programs for Atari systems.
The latest archive is there (88 Kb, only sources, no binary):
http://membres.lycos.fr/pmandin/download/src/cleancode-0.6.tar.gz

It contains:
- Bugfixes
- Video: Added cookie detection for Overscan hardware.
- CD-ROM: Preliminary test program for Metados.

I need the Metados developper disk from Atari, so if anybody can send it to me, I will be grateful. I don't need the bindings for Metados functions, I have them.

Thanks.

If you're lucky (all the -D entries must be the same) then "make -n
>foo" on CygWin will give you a file from which a config.h can be
built from. Amazingly (I can't even usually manage this much) this
snippet may then be useful. From CygWin bash (all one line not wrapped
like here)...

```
for i in `cat foo`; do echo $i | sed -e 's/-D/#define /' -e 's/=/ /'
-e 's/-.*//'; done
```

...which should change all your -D arguments into #define's and remove
all the switches. There'll be some other junk (filenames for sure)
that have to be cut manually. Sorry about that - couldn't figure out
how to get shot of those without mangling the #define's.

More long term solution might be the CygWin m68k cross-compiler. Bah -
can't find the link. I'm as tired as you were! Look back through this
group and you'll find it. ;-)

I am not sure that this will work as the makefile is a real mess. (and of course I need different arguments for TOS as for cygwin.) In fact I can dispense with most of the "-D"s as they turn on options which are not supported in TOS, and I can now comiple about 50% of the code.

This is a GREAT idea! This should remove the filenames too:

```
  for i in `cat foo`; do \
    echo $i | sed -e 's/-D/#define /;/[^#]/d;s/=/ /'; \
  done
```

laurent.

I don't think that won't work as we have lots of things like :-

PRINTDIR = /tmp
DPRINT = -DPRINTDIR=\"$(PRINTDIR)/\"

in the makefile. Any way I am now switching to Mint as some other libs
are need are only in Mint. Will let you know how I get on...

Dave.

Why are you posting anonymously? and why are you calling a dead common modem
as "rare". those were built in the thousands, they're far from "RARE".

then this?

```
  for i in `cat foo`; do \
    echo $i | sed -e 's/-D/#define /;/[^#]/d;s/=/ /;s/\\"/"/g'; \
  done
```

(just joking. use MiNT.)

Now have working Mint. Which editor and shell ?

I think EMACS for the editor ?
But a shell, I don't like BASH ? what about plain old SH ?
Any idea where to get,

> Laurent.

Okidoki. You've probably completed it by now but just in case, perhaps you missed my mention of "make -n"? The above wants applying to the "make -n" output not the makefile itself. ;-)

Good Luck!

Hi everyone,

I've been a longtime Atari user and have been an Atari ST user since
1987. I never got into programming because I could never do complex
programs in Atari Basic for the 8-bit machines. The best I could do
was using some variables with IF...THEN loops, PLOT, DRAWTO graphics
commands, and then copied bits of programs from type-in programs in
magazines such as COMPUTE!, Antic, etc. to see what each chunk of code
did. Problem was that I couldn't understand these chunks of code.
:-(I took a FORTRAN class in college and squeaked out a 'C' grade.
And since there were a good number of ST programs, I never really had
an itch to get into programming.

Fast forward to now, there seem to be fewer ST programmers than ever.

I feel like making a contribution to the ST community, but my past programming experience has made me think twice about the headaches involved in debugging. (That's why I didn't do well in FORTRAN - my program looked like it's suppose to work, but it didn't and I could not find the bugs before the assignment was due) *End of life story* :-)

With this background, is there any hope for me getting into programming?

I'd probably want to start in BASIC again, but which is better and has more resources, sample commented code and tutorials - Hisoft or GFA?

Feedback is apprciated.

Thanks, Phil

Hi,

For BASIC GFA is only real choice.. It is very powerfull, compiler is very good too, docs are there and not last, there is bunch of GFA programmers as well...

Hello,

@With this background, is there any hope for me getting into
@programming?
@I'd probably want to start in BASIC again, but which is better and has
@more resources, sample commented code and tutorials - Hisoft or GFA?

GFA !
We do a game in compiled GFA with some assembly routines.

Try GFA, it isn't that much complex, and less than Fortran.

Regards

I don't understand what your problem is.

Here is a sample Makefile fragment.
It is extracted from the EmuTOS Makefile which can be browsed at:

  http://cvs.sourceforge.net/cgi-bin/viewcvs.cgi/emutos/emutos/Makefile

Laurent.

Laurent,
 Sorry, not even tried make just did :-

```
$ m68k-atari-mint-gcc hello.c -o hello.ttp
Assembler messages:
 for reading.open
: No such file or directory
```

If I do a "gcc -v" it is calling the correct assembler. Any hints ?

Dave

Maybe. 'makefile' variables?

<side-issue>
Lest I forget (I assumed it was my fault) - iirc just a single library
(maybe libm.a but not certain) managed to "escape" from

/lib/gcc-lib/m68k-atari-mint/2.95.3/m68020-60...

and made an appearance as /lib/libm.a (replacing the cygwin/gcc one)
thereby causing some strange errors. I mention this just in case you
want to check your /lib/libm.a timestamp.
</side-issue>

I did have an initial compilation problem. No idea what it was though,
except once located, trivial to fix. Sorry! Might have been 'specs'
(compare attachment against yours).

I remember being in here: it may be just that, a memory, and nothing
wrong at all. Just in case...

J:\cygwin\bin\m68k-atari-mint-unprotoize.exe

I havent tried hisoft or gfa basics yet but I hear GFA seems to be a bit more
popular. C is another popular choice on the ST. Theres even a shareware
fortran called "bc fortran" as well.

Really?! Ok, then. Are there any good books/tutorials that are
online (I doubt there are any in print, correct?) that I can check

out?

I have a bunch of old Atari Computing magazines that have tutorials on
HiSoft BASIC. Would any of it help?

While looking through those magazines, I saw a package called Enchant,
which includes a whole bunch of sample code with everything from
printing with NVDI to Y2K fix. Is there an equivalent package for GFA
Basic? I'd like to take advantage of the latest protocols such as
non-modal boxes, radio buttons and such.

Finally, what's the latest version of GFA Basic? (IIRC, it's 3.6e?)
I have an old version 3.0 package with manual and disks. Will this
do? If not, how can I upgrade?

Thanks for your input!
Phil

𝍐Really?! Ok, then. Are there any good books/tutorials that are
𝍐online (I doubt there are any in print, correct?) that I can check out?

I saw a 'your second hand gfa manual' somewhere, maybe on Chapelie
(193.190.204.128) but I know that www.gfa.net may exist.
There are a lot of gfa site, but as the more active programmers are German some
home page are in German. Don't worry, all doc they provide are in German and
English.

Don't know

>Finally, what's the latest version of GFA Basic? (IIRC, it's 3.6e?)

I use 3,6, don't know what is the 'e' for.
I read a th orical 3,7 but never read more.

>I have an old version 3.0 package with manual and disks. Will this
>do? If not, how can I upgrade?

3,0 is good. 3,6 include TT sp cific functions.

If necessary, you can reach me at yves.rogne@free.fr

Er, I can't see them. Are there any attachments?

"specs" and "makefile.g++2.m68k" again in case I was being dozy.

I do hope I haven't got a news-server bug.

If you want a simple way to make modern looking applictions in GFA BASIC
take a look at Face Value. I think it is still supported but newer
versions are German only and it is commercial. Sorry no link to offer
right now...

Face Value will give you a sort of "Visual Basic" environment where you
don't have to do any of the hard work yourself to write GUI programs with
all sorts of buttons, popups, windows, etc..

>Finally, what's the latest version of GFA Basic? (IIRC, it's 3.6e?)

Yes. but you should upgrade/patch the compiler libraries anyway.

>I have an old version 3.0 package with manual and disks. Will this
>do? If not, how can I upgrade?

I guess it's OK. There were some matrice functions etc added to the 3.5
but at least my manual is still for 3.0 . 3.6 is 3.5 with some fixes in
the editor so it runs better on a TT.

You might take a look at what bugs were fixed after 3.0 and try to avoid
these when still using 3.0 .

I use GFA myself. Once purchased HiSoft basic and ended up re-selling.
There is various resources for both, docs and the like. I found the HiSoft
editor to be a pain. That's just my opinion though. Still using GFA.

You can find some GFA-Basic related stuff at my site:

could you show the output of the gcc -v command?
by running the connads manually (step by step what gcc -v tells),
is the assembler file generated correctly?
do you have a space in you TEMP directory pathname?
are your disks mounted in binary mode?

Apart from these I don"t have a clue.

Laurent.

Could try CygWin source - they use 'ash' as 'sh'. It won't
cross-compile OOTB (I just spent 30 seconds trying) but after 30
minutes of adding __MINT__ into conditionals I got it launched into
VT52 under MagiCPC - I am truly f..f.. [cough] *amazed*.

Drat. I hoped I'd be okay uu-encoding them into the body. I emailed
"specs" to Dave and apparently the problem has gone away.

I imagine you never got my STonX changes either. Did you get it
working? I should still be able to dig those out.

Guys,
 I think I have found my problem with the cross compiler. I had unpacked it
using Windows utilities. If I unpack it from the command line in CYGWIN it
all seems to work o.k. At least I can compile and run a simple "C" program
without messing around.
  Dave.

Hello Everybody,

I didn't saw so many writings in this ng for a long time !

Does anybody knows to drive a CD from a gfa or assembler ?
I got some exemple in C but don't know that language.

Regards

Please do not assume no posting means no activity... Better assume no
problems => no questions! ;-)

> Does anybody knows to drive a CD from a gfa or assembler ?
> I got some exemple in C but don't know that language.

Just post it (or an excerpt if it is too long) here as someone (me ?)
could surely translate it to you.

HI all,

DDP Translations has need of a utility that will extract text from a binary
to the screen and/or text file, and after editing/translating it, patch the
binary with the new text.

TTPs are no problem, and we'd like to be able to include it alongside the

patch text for any future DDP Translations releases.

At the moment we're using a utility written by Richard Faika, but it will
only extract text from the data section of a program, sadly not all
programmers have compiled their programs in this way :-(

Anyone up for this?

Cheers

Derryck

Hi, Derryck!

> At the moment we're using a utility written by Richard Faika, but it will
> only extract text from the data section of a program, sadly not all
> programmers have compiled their programs in this way :-(

Does RGFs utility allow to replace the extracted text areas by longer
ones?

If yes, his utility will have to scan the code segment and patch it so
that changed addresses within the data segment will cause no problems.
(This is the hardest part to implement at least.)

If not, everything is easier. Extracting and patching text from the whole
program code should be no problem then. Ask Richard to change his utility.
If he says no, I would write such a utility for you.

Greetings,

Alexander Beuscher

For the extraction part, the program 'strings' (from the 'binutils' package of any MiNT or Linux-like distribution(*)) would do the job for the extraction part, provided you use the options to scan the entire executable (-a) and print offsets (-t <base>).

(*) You can also find it here (according to Julian F. Reschke's homepage):
<ftp://ftp.uni-muenster.de/pub/atari/Gemini/mupftl14.tos>

> TTPs are no problem, and we'd like to be able to include it alongside the

Nice idea!

Sure Richard could do the patch part? (Better use hexadecimal offset output (-t x) as it is easier to parse!)

Another possibility is to ask Vassilis Papathanassiou to do a PRG_TRANS, as its RSC_TRANS is quite nice!

>Does RGFs utility allow to replace the extracted text areas by longer
>ones?

No, it truncates any text that is longer than the original (it also pads

text that is shorter with spaces).

>If yes, his utility will have to scan the code segment and patch it so
>that changed addresses within the data segment will cause no problems.

I guess that this wouldn't work if the utility was to check the whole of the program since there would be jump tables and etc involved (I'm out of my depth here as I'm no programmer!).

>If not, everything is easier. Extracting and patching text from the whole
>program code should be no problem then. Ask Richard to change his utility.

We've asked Richard a few times now but he's said that he's too busy which I respect, despite our need!

>If he says no, I would write such a utility for you.

That would be most excellent :-)

As a first step, I've emailed you Richard's utility (I've already asked permission to include it with our patch texts, so there should be no problem) so you can see the sort of thing. Please tell me if you don't recieve it when you read this.

Cheers!

Derryck

I'm trying to write my first STOS 3D game and am having trouble with the intro screen, I thought that one method of solving it might be to take several snapshots (about 30) of the screen and store them as strings (either in a file or bank) so that they can be loaded and then dispalyed in sequence like the frames of a film to produce an animation.

So does anyone know how to store and retrieve serveral stings from one file/bank?, also would each string stored need a different name to be able to recover them?
Alternatively does anyone know how to get STOS to run IFF animations created by Delux Paint?.

While I have the attention of any STOS users who may still be out there do you know of any active STOS users groups/mailing lists as the list at Manchester University which had about 20 subscribers has closed. I know it did not recieve a lot of postings but I was nice to have a place to go if you needed help and advice.

Is MiNT the issue? See the (*) "footnote", the auto-extracting archive
contains a file "strings.ttp" that AFAIK works under plain TOS or
MagiC too...

Hello,

Some PC emai programm allow to recieve a reciep sent back to sender when the email is read.

Does anyone knows the string I have to add to my mails to enable that feature in my mails ?

Regards

One extra line is needed in the header and can look like this:
Disposition-Notification-To: =?iso-8859-1?Q?Erik_H=E4ll?= <erik.hall@affv.nu>

MyMAIL supports reciepts.
can be found under
http://212.214.15.116/~erikhall/mymail.html

I don't know what KCS is but I went and got Steem, which is returning
the correct codes ($0072000d for Enter and $001c000d for Return as
returned by a simple Bconin(2) loop).

On the other hand, the MagicPC demo has always had a couple of "dead"
keys, most notably "\" and eventually I had to resort to mapping that
to SHIFT-3 (uk sterling symbol £). By "dead" I mean *nothing* came out
of the PC keyboard when I hit uk "\".

In both cases I'm inclined to blame the PC. You might try installing
the locale for which KCS was written though you may end up with my
MagiCPC problem instead. It's easy enough to switch back.

That's all I can think of. :-|

Hi Folks,

I'm too rusty. STonX (compiled with cygwin) writes to the last two
bytes (as a single word write) of the cartridge port $FBFFFE, dumps
out a bus error 49693 instructions in, then continues upon its way.
Does anybody know if it is supposed to do that? That was with tos1.2
and does a similar two bytes (different cartridge address not to hand

but identical asm routine) for tos2.06. In both cases afterward it
then seems to be sat doing the 200Hz interrupt and not a lot else -
aside from consuming a lot of cpu.

Just trying to work out if I've configured it wrong. I've never seen
STonX run. "stonx -fs A:/usr/local/share/stonx -mono -noaudio
-monitor" is what I'm using atm. Tried "-nocart" also but no effect on
the problem.

Hi Folks,

How do I correctly force CRLF upon streams instead of the default
binary mode?

"stdout->__mode.__binary=0"

...was the best I could come up with, which didn't work reliably. I
was under the impression MiNT code adapted automatically? UNIXMODE
isn't set btw.

TIA

What version of STonX?
Me myself I do run plain old STonX0.6.7.epsilon, because at some
time the new CVS version didn't quite work on cygwin.
For 067epsilon, I use option -realtime as the virtual timer
is not implemented right on Cygwin.
Hope it helps.

Laurent.

The CRLF problem is really problematic. What problem do you have? And why
you don't set UNIXMODE?

You can patch *everything*. How much of the original remains is a different topic ;-)

Hacking in TT-RAM support for hardware that has it (on the normal addresses, ie. $01000000 up) should not be a big deal - for the Milan, it was as simple as setting the magic and end address variables (although we removed the memory test in the Milan TOS - the Milan bootblock has already tested memory when TOS takes over the system).

I tried 0.6.7 first, epsilon I think - from sourceforge. I then got
the CVS version (because monitor.c and other related things missing).

>Me myself I do run plain old STonX0.6.7.epsilon, because at some

Excellent! Thanks. That got things moving. The CVS version now works
if I use "-chunky" as well. ;-)

CVS didn't compile as-is though. I did some non-essential script
tinkering (added a cygwin config), that kind of thing. No code changes
but I've been too drastic in options.h (disabled everything that
obviously wasn't essential). I may get round to slowly turning them
back on again.

MagiCPC (VT52) is getting LF instead of CRLF for screen output. I
can't even consider debugging it there because it's only the demo. Now
that I've got STonX compiled I see unfortunately it is the same
LF-only output as well (.TTP ran direct from Gem 1.02 and 2.06
desktops).

>And why you don't set UNIXMODE?

Originally I didn't know about it until I trawled deja for some old articles. I got the impression that if UNIXMODE was omitted from the environment then the code would adapt automatically. Since posting I've tried setting "_ENV UNIXMODE=" in magx.inf but to no avail. I saw mention of the 'b' force-binary character but not anything for a force-dos mode. Is this correct?

Any help much appreciated.

dos mode is default if the stream isn't in binary mode. If the binary flag isn't set the __stdio_text_read/__stdio_text_write functions are used for reading/writing to the stream (see mintlib/stdio/sysd-stdio.c and mintlib/stdio/internals.c, function __stdio_check_funcs).

Btw. in the current mintlib the stdin/stdout/stderr descriptors are in binary mode by default for various reasons.

I'm interested in knowing what you did to let it run on cygwin.
Can you send me a patch or explain what you did?

Hi,

Some versions of PalmOS supports greyscale on mono LCD:s. I think this done
by toggling b/w at different frequencies to get different shades of grey.
(And / or some puls modulating)
This requires that the LCD is a bit slow, just like on the STacy.
On the palm, this looks great btw. You can't see the flashing at all.

Now, the problem is that I don't have a STacy, so I can't try this. But I
thought it would be a cool thing to do, perhaps by making a STacy-Greyscale

driver for fVDI or something..

Regards

/Peter

Can you help me or do you know anyone who is very good in assembly languge
Motorolla 68k programming. I must complete a program in assembly language
until Friday (3 May)!
I must write a program which draws a graph of y=x^2 by writing a series of
spaces followed by '*'.
It must be like this:

```
            *
         *
      *
    *
  *
 *
  *
    *
      *
         *
            *
```

The number of * must be eleven.
Please help me!!!
I have done this already but it doesn't work.

```
     ORG 1000
     MOVE.W $2000,D0        *X VALUE
     MOVE.W $2000,D1        *X VALUE
     MULU.W D0,D0
     MOVE.L D0,$2002        *Y VALUE
LOOP:    SUB.L #1,D0
     BEQ NEXT
     BSR COUT1     *PRINT OUT X-1 (_)
     BRA LOOP
NEXT:    BSR COUT2     *PRINT OUT (*) CARRIAGE RETURN, LINE FEED
     BSR END

COUT1:   MOVE.W (A6)+,$5F
     BSR COUTC
     RTS

COUT2:  MOVE.L (A6)+,$2A
     BSR COUT
     MOVE.W (A6)+,$0D
     BSR COUT
     MOVE.W (A6)+,$0A
     BSR COUT
     RTS

COUTC:   TRAP #15
     DC.W $12
     RTS

END: TRAP #15
     DC.W $10
```

Hi here :-)

> Some versions of PalmOS supports greyscale on mono LCD:s. I think this
done
> by toggling b/w at different frequencies to get different shades of grey.
> (And / or some puls modulating)
> This requires that the LCD is a bit slow, just like on the STacy.
> On the palm, this looks great btw. You can't see the flashing at all.

> Now, the problem is that I don't have a STacy, so I can't try this. But I
> thought it would be a cool thing to do, perhaps by making a
STacy-Greyscale
> driver for fVDI or something..

Well, it's a great idea of course, but I think greyscale is possible when
the machine
has a sufficient power capability to satisfact greyscale processing WITH all
global
taskes... This would require very optimised assembler routines I think.

Mathieu

>Can you send me a patch or explain what you did?

I've managed to go months without knowing anything about patches, so
rather than do a hurried read-up & make a complete mess of it, here's
the files I've changed. I'd imagine if cvs hasn't changed in the last
couple of weeks you'd be able to produce your own patch.

Things to look for are three tilda ~~~ which I often use to mark
changes (until I get too bored) and macros indented "strangely"
compared with the style used. In this case it looks like I've indented
them by one tab (eg options.h where's I've conditionalised some so
they can be affected from cygwin's config). Thinking of that just grep
for "cygwin" (insensitive) in configure and config.guess and you'll
find the changes to get the config found.

Once that's sorted the bash script "go" has the actual settings I last

used. Strangely the monitor used to work (when STonX didn't) and now
that STonX does the monitor doesn't! However, atm my working STonX
still has it configured in and built. Console info still appears -
you'll see a few 68k bus errors reported as it starts.

If there's anything else let me know. :-)

That's made it clearer thanks. I'd noticed the static stdin/out/err
definitions but kept thinking I might have missed something somewhere.

>Btw. in the current mintlib the stdin/stdout/stderr descriptors are in
>binary mode by default for various reasons.

I guess the solution is to check for UNIXMODE first then if it doesn't
exist change __binary according to the OS.

I delved into the "unreliable code" (bzip2 verbose output).
Embarassingly I'd neglected to turn binary mode off for stderr - which
is what bzip2's lib uses [Ahem].

Ugh - this one. I remember this one. They should have put this one out of its misery years ago! You've no doubt realised the problem has got little to do with plotting points, rather how to muck about getting the console output in the right order. Split it into two, possibly three parts. Obviously the top half is a mirror image of the bottom - the possible third part being the zero point. You can't control 'X' (y-lines on the console) so begin at "(11 - 1) / 2)", count down through zero then back up to "(11-1)/2".

```
>
>    ORG 1000

>    RTS
>
>END:    TRAP #15
>    DC.W $10
```

I'm not writing the code for you. This snippet of C++ is easily converted...

```
#include <cstdio>

namespace sd{typedef unsigned short uint16;}

static sd::uint16   d0,d1,d2,d7;

static void
out(void)
{
 d2 = d1;

 while (d2 > 0) {
    putchar('.');
    d2 -= 1;
 }
 putchar('*');
 putchar('\n');
}

int
main()
{
 d7 = 11;
 d7 -= 1;
 d7 >>= 1;    //shift right one btw (ie d7/2)

 d0 = d7;

 while (d0) {
    d1 = d0 * d0;
    out();
```

```
    d0 -= 1;
 }

 while (d0 <= d7)   {
    d1 = d0 * d0;
    out();
    d0 += 1;
 }

 return 0;
}
```

...actually I was going to post the 68k asm output from gcc with a comment to the effect "if you copy it they'll know". Unfortunately the code it generated was too close to the mark, so tough! ;-)

Hi again,

> Well, it's a great idea of course, but I think greyscale is possible when
> the machine
> has a sufficient power capability to satisfact greyscale processing WITH
all
> global
> taskes... This would require very optimised assembler routines I think.

Well, Yes - and No. If we use the colour-emulator approach, it will be quite
slow. But if you implement a completely new graphicsmode with a new VDI
driver for fVDI, it could be done pretty fast.

Lets say we use 4 copies of the screen in memory, and just toggle fast
between them. As the ST has a "floating" videomemory, we don't need to copy
anything to "refresh" the screen, so it would be very fast.

On a normal mono-monitor, this would give you migrane. On a slow LCD, it
would give you shades of grey. (Provided that the toggling is done at a
frequency that suits the LCD)

OK, this wouldn't give us 16 shades (2*2*2*2) like in "normal" colourmodes,
but 4 (1+1+1+1).

I tried this on an old PC laptop the other day, and it works. Too bad I
don't have a Stacy to try it on.

Regards

/Peter

groups%3Fq%3Djohan%2Bklockars%2Bfvdi%2Bnative%26hl%3Den%26selm%3Daa62ij%2524kav%25
241%2540nyheter.chalmers.se%26rnum%3D1>
(title is 'Re: fVDI and "native" drivers (Re: Dumb question maybe)' in
comp.sys.atari.st).

AFAIK as fVDI is modular (according to the docs), the only thing one
would have to do is to implement a few simple primitives ("put pixel",
"draw horizontal line", "draw vertical line", ... perhaps even only
"put pixel") and one would be done!
A good starting point for this would be the 4-plane driver but IIRC
but there are only 1, 4 and 8 plane drivers ATM... :-(

So please do some lobbying on Johan so that he makes drivers' source
code available! ;-)

Quite possibly.

>> Lets say we use 4 copies of the screen in memory, and just toggle fast

Not necessarily. Take a look at the image processing/viewing program
MGIF (currently at v5.10 beta 5 [970707]), which can be found on my
Web site and elsewhere (I took over the development of MGIF in '92,
but have, unfortunately, not done anything with it for the past five
years). Its original purpose was exactly what you are talking about
- displaying stuff (well, images) in 'greyscale' on monochrome monitors -
and that functionality is still in there.

>> OK, this wouldn't give us 16 shades (2*2*2*2) like in "normal" colourmodes,
>> but 4 (1+1+1+1).

You only need to flicker between three screens to get 4 greyscales
(no set pixels, one set pixel, two set pixels, three set pixels).

Two screens would give you 3 greyscales, and four screens 5 greyscales.

The way to avoid migraine is to use some kind of dithering so that
the set pixels are evenly distributed among the flickering screens.
That is, a small 25% grey area could be built up of three screens
something like the following:

```
100   010   001
010   001   100
100   010   001
```

As you can see, a sequence of the three images would have every pixel
as 1 one time and as 0 two times, but unlike for

```
111   000   000
111   000   000
111   000   000
```

the timings would be evened out. The former case can look very good while the latter can indeed easily make your head hurt.

As I said earlier, take a look at MGIF.

>AFAIK as fVDI is modular (according to the docs), the only thing one
>would have to do is to implement a few simple primitives ("put pixel",
>"draw horizontal line", "draw vertical line", ... perhaps even only
>"put pixel") and one would be done!

While this does not really have anything to do with modularity (it's simply a matter of the fVDI engine providing 'fall-back' functions that can do more complex operations using simpler primitives), it is indeed true. I have even written such a minimal driver for monochrome mode (the currently required functions are write_pixel, read_pixel, set_colours and get_colour (the latter two for palette handling)).

Horizontal and/or vertical lines are actually not primitives that are directly supported by fVDI. I know that many other graphics libraries have such, but I've never understood why (it's very simple to special case the handling of thin rectangles or general lines, which are much more useful primitives, at completely insignificant performance cost). That said, you could indeed implement only those special cases in an fVDI device driver and return more difficult lines/rectangles to the engine, if you wanted.

>A good starting point for this would be the 4-plane driver but IIRC

I don't really think so, since that one contains a lot of assembly code and is not particularly easy to understand. Also, the dithering that you would most likely want to use might be easier to do if you used some more fitting intermediate pixel format (for example, you might want to draw in byte per pixel mode and then convert larger blocks at a time for displaying).

>but there are only 1, 4 and 8 plane drivers ATM... :-(

There has never been a working 8 plane driver. The 2 plane one might have worked sometime at the beginning, but that was a long time ago. There is a 16 bit (word per pixel (FalconTC)) driver, though, that is almost 100% C code.

>So please do some lobbying on Johan so that he makes drivers' source
>code available! ;-)

No need to do any lobbying for that. fVDI and most of its drivers are under the GNU GPL (This does not, for the time being, include the ATI RageII driver since it relies on information (and still, to

a very small degree, source code) from ATI that is not publically available. Nor does it apply to the 16 bit driver sources, which are in the public domain (since that driver is intended as an example and I did not want to hinder any possible future commercial driver development). The sources for the 16 bit driver have been included in most real release archives, IIRC.).

Within the near future, I will have a CVS server up and running, where the fVDI sources (among other things) will be publically available (write access will be granted on a case by case basis). The Linux server that will take care of the CVS is already working fine (it is responsible for my recently resurrected Web site). I just need to set up a few more things and move the CVS archive over from my main PC.

I did just that (TT-Digger rules !) and it seems that a part of it is
encrypted/compressed in some way...
But apparently all Fast-RAM init related code lies untouched at the
beginning of the Flash code (which follows the standard TOS-executable
format BTW).
I browsed through the memory test (interesting part :-)...) and it
seems that a simple patch could be made to make a N-revision board
work. But do not expect it to work on non N-releases then!

> > > Well if the memory-mapping is the only difference, perhaps some sort
> > > of FASTRAM.PRG to declare how much Fast-RAM is available (and where)

> If I have some time this week I will try writing a simple FASTRAM.PRG
> program...

Tried to execute the following program at the beginning of the AUTO
folder (I have a 32MB CT2B fitted:

```
 pea superb(pc)
 move #38,-(sp)  ; SUPEXEC ($26)
 trap #1  ; XBIOS
 pea 32*1024*1024 ; 32MB
 pea $04000000
 move #20,-(sp)  ; MADDALT ($14)
 trap #1  ; GEMDOS
 move d0,-(sp)
 move #76,-(sp)  ; PTERM ($4c)
 trap #1  ; GEMDOS
superb:
 sf $f7000000 ; 16/32MB SIMM CT2B (see CHPB)
 rts
```

... and it bombed (very randomly) my Falcon to death... well, until
the next reboot!

Any hints??? I cannot believe that programs (and TOS) could be *that*
incompatible to a $04000000-starting Fast-RAM block...

I wondered if it is an XFRB/_FRB issue... As HD-Driver is started
after my patch, it does not know about the Fast-RAM being available,
so I guess it sets no XFRB cookie... As for the _FRB cookie, I wonder
if it is useful on Falcon too (I have a SCSI drive attached)...

Perhaps there also are other Fast-RAM related issues I do not know
of...

Mmmhmm... (Just though about it:) Perhaps the PMMU-tree is not
properly set for >16M adresses... Will check that soon...

BTW the adress-bit #23 of $F6xx0000 seems to control whether one boots
from Flash-memory or from ROM... So an emergency program to recover
from a corrupt Flash code should be easy to write! :-)

Just a Reminder about Jagfest 2002 on july 12th and 13th in Saint Louis,MO:

Admission cost for this event is $25.00 for those who wish to pre- pay and $30.00 for those who wish pay at the door; this cost covers for both days.
Table prices are as follows (admission price is included): Visitor tables: $35.00 before July 9th (after July 9th its $40.00),
Dealer Tables: $45.00 before July 9th (after July 9th its $50.00) (extra tables are $5.00 each).

Also for those people who want to place an ad in the fest program here are the prices:
$15.00 for quarter page
$25.00 for half page
$50.00 for full page
A listing on the back page is under $15.00
For full details on how to place your ad in the program contact Greg George.
You can pay either by paypal (greg@ataritimes.com) or by sending a Check or Money Order to Gregoary D. George, 347 Banyan Drive, Winter Haven, FL 33884
Attn. Jagfest payments
For more information On Jag fest 2k2 e-mail Greg George at greg@ataritimes.com, James Garvin at omc@omcgames.com or Daniel Iacovelli at atarivideoclub@yahoo.com or visit the Jagfest 2002 site at http://omcgames.com/jagfest/
(be sure to visit the Jag fest message board and post your ideas for this event.)
---
like to help spread the word on Jagfest2k2 e-mail me
(atarivideoclub@yahoo.com) ask about getting the Jagfest Flyer to pass out at your area.

Hi,

Can anybody tell me the color register indices for VDI for 256 color mode ? All the books I have only list indices for up to 16 colors since they obviously were written in pre Falcon times.
BTW, I always wondered what reason could be behind mixing the colors as it is done at outputs via VDI. Anyway It would be nice if somebody could help, and spare me the task of writing a test program to find out about VDI and 256 color mode indices.

Thanks
Gerhard

Hi,

> All the books I have only list indices for up to 16 colors
> since they obviously were written in pre Falcon times.

As far as I know there is no standard palette for 256 colors.
Atari never defined something like "VDI color 154 is light red
(=red 900, green 700, blue 700)".
So you can't assume that an index has the color representation
which it has on your Falcon. But I think most of the people
use the standard palette if the Atari VDI or the new (better)
palette from NVDI.

I think Atari defined only the first 16 colors because the user
interface (=GEM) only uses the first 16 colors. The other 246
colors can be changed by the applications.
This approach gives us a strange looking screen in a multitasking
environment in which more than one program uses more than 256
colors. (=the windows in the background use also the current
palette in the 256 color mode)
So it's not "nice".

Regards
Philipp

Sorry, it seems I didn't make my problem clear enough. My problem is not about the RGB values of certain VDI color indices but the shifting of color indices VDI (and NVDI too) does. For example when I make my program read a picture with 16 colors and display it on screen, when using VDI functions to set the colors according to the picture palette, I have to use a color index different from the index in the picture palette, using certain rules that can be found in books like e.g. the Atari Compendium etc., e.g. 2->3, 15->13 etc. to get the right colors on screen. Now for 256 color pictures these color index shifting rules seem to be similar than for 16 colors but not exactly the same. Color indices from 16 to 254 seem to be identical in picture and VDI palette but at least index 255 has to be changed (to 1 ?) which causes changes in the others between 0 and 15.

regards
Gerhard

I have this table in the ximgload.c file in boinkout2's source code.

The short answer is it's 1 to 1 excet for the changes for 16 color modes and
1 = 255
255 = 15

so it's
0,255,1,2,4,6,3,5,7,8,9,10,12,14,11,13,16,17,18,19,20....
...251,252,253,254,15

So that's why the games I wrote before seemed to work okay when I
used the same changes as for 16 color mode.

Many thanks
Gerhard

Hi All!

Does anyone know, how to use the shared-library 'LOAD_IMG.SLB' which is in
magic 6.x included ?

Thanks

Emanuel

Weiss irgend jemand, wie ich die in Magic 6.X beiliegende LOAD_IMG.SLB
benutzen kann? Also was f⍰r Aufrufe etc...

Danke

Gruss

Emanuel

hmmm... Does anyone have a clean routine, wich loads ximg files to a memory-block, so that I just have to blit it
on the screen? (I code in Gfa-Basic, a inline would be the best)

Would be great, because the file format is very hard to understand...

Aah! : And what's about the efm-modules, which comes whith papyrus? (And an old grafik-program called 'True Paint' use it too)
And why is it not easy to find routines for ximg-files? I think its the atari-standard graphik file format...

Thanks

Emanuel

Jagfest 2002 Goes to New Dimensions

For Immediate Release:

June 1st, 2002

(St. Louis, MO.)-- In what could be considered an unprecedented move, the organizers of The Sixth Annual Atari Jaguar Festival have decided to broaden the scope of the event by showcasing not only the Atari Jaguar, but classic and next generation systems. Adding to this, Jagfest 2k2 will also provide an avenue for creators of "homebrew" software to show their creations to the world. Last years Jagfest in Milwaukee, Wisconsin set the stage by allowing non Atari systems to have a limited presence. This year that idea will be taken further by making their inclusion official.

James Garvin, owner of OMC Games and a principal organizer of this year's Jagfest, states: "Jagfest symbolizes what can happen when a group of gamers actually care about their games, and it has survived this long because of dedication from its community. Our goal is to insure that Jagfest will survive for years to come, and to do this the concept of what Jagfest stands for can be expanded to include gaming in general. The "Jag" in Jagfest won't be lost, though. It will still retain a major presence in the show, but gamers of all types should be able to share some of the same heritage that has kept the Jaguar alive after all of these years. This change is just a natural progression of the show."

Daniel Iacovelli, Founder and President of The Atari Video Club and co-organizer of this year's Jagfest also states:" The addition of old school and next generation will add a new dimension to the event. My club has seen the progression of this event since its start in 1997, from just Atari Jaguar and Lynx being shown at the first event to the addition of classic systems shown at the last year's event, it just seemed natural to continue from that plus extending it to new dimensions".

The Sixth Annual Atari Jaguar Festival (dubbed Jagfest 2k2) is being held in downtown St. Louis, Missouri at The Mayfair Wyndham Historic Hotel. (806 St. Charles Street St. Louis, Missouri 63101. Phone: 314-421-2500) on Friday, July 12th and Saturday, July 13th 2002.

For more information On Jag fest 2k2 e-mail Greg George at greg@ataritimes.com, James Garvin at omc@omcgames.com ,Daniel Iacovelli at atarivideoclub@yahoo.com or JT August at starsabre@worldnet.att.net visit the Jagfest 2002 site at http://omcgames.com/jagfest

(be sure to visit the Jag fest message board and post your ideas for this

event.)

i am in dire need. not quite life dependant but close need for the inter/lisp-65
package that was produced by datasoft in conoga park. there is a cd produced by a man who's name sounds like sympothy whine and he is to be assosiated with a great fire y bird that is a symbol of change. this cd this thief man produces has a small amount of the package on it, but due too the dishonest and chicken hit way he conducts himself in what i hope is an attempt to be a man, though he is so far off i am not sure he intends or portends to be a man, i will not utilize this grown childs resource. i do not find it easy to benifit from the work of a criminal.
i have a very complete.. very complete atari collection...(this is due, nearly entirely, to another mans infinite generosity) so i have some very very good items to barter with. items that are not up my alley but might be a concrete definition to another Atari user. i would like to stoke out the person who could find me this lisp implimentation in completeness. it is disk based and has nice books that are part of the package and intigral to understanding the atari lisp subset.

so far in these monthes i have sought to procure this software package i have not hit any good luck. it exists and michael (small fruit, i believe similar to a cranberry but also what exists as dangerouse in moving water) lightly details it in the nice 8-bit faq he so nicely maintains.

lisp is the jist at least in my world right now. i have it on this pc but i would love to be programming in lisp on my favorite platform even though it is a mere subset.

interlisp/65 for our machine is comprehensive enough for some nice programming. somebody, if possible, help me get this and i believe i can return in gratitude some software equally desired by WHOEVER can get me lisp. i have an impressive amount of software all complete or nearly complete and in good condition. i may be persuaded to trade a complete original good condition fully functional MULE package for it. MAY BE ABLE.... someone talk to me ..i can make it cool for the one who can produce it.

June 4th, 2002 - Midwest Classic Host Large Display of Vintage Computers

Let the Midwest Classic take you back to the glory days of personal computers, when people had choices beyond a Windows or Macintosh based computer. Sponsored in conjunction with the Classic Gaming Museum, the Classic Computing Museum features a large display of 8 bit and 16 bit computers from the industry's beginnings in 1975 through to the last days of the 16 bit computers in the early 90's.

Of special note this year is a large section devoted entirely to Atari computers,

and will include many hard to find Atari peripherals in their pristine condition. Visitors will also have the opportunity to leave their mark on this historical event by stopping by at the Atari 400 Guest Station, where they can enter their name and a personal saying for other visitors to read.

The Classic Computing Museum will have a large selection of items on display for visitors to see, learn about and play. Each display will contain a small description and history of the items in the display. Not all items on display will be playable. Classic computing expert and ClassicGaming.Com editor Marty Goldberg will be on hand to answer visitors questions and guide them down memory lane.

"I look forward to exposing people to a rich and vibrant history they may not be aware of." said Marty. "Likewise," he continued, "those who are old hats to the subject will be pleasantly surprised as well by the extent of the display. Definitely something for everyone."

More information about the Midwest Classic may be found at the Official Midwest Classic Web site at the GOAT Store, LLC (http://www.goatstore.com). Dan Loosen can be reached at loosen@goatstore.com and Gary Heil can be reached at heil@goatstore.com for more information on the event.

Hi all,

Not really a question about programming, more a hello from someone who

used to be in here all the time! Glad to see the comp.atari groups are
still so well used.

Cheers,

Jim.

Hello Everybody,

Does some of you knows to use m@tados from gfa or assembler ?

I'm beginning to programm in 68060 and need to drive a CD audio.

Regards

No they havent, asshole!!.

No need, here in france, regular backups of IPS are enough.

>> They can recover from your PC every single picture or item you have
>> ever watched on the Internet.
No you cant.

Sorry, they can retrieve any information after 4 hd low level format. They uses kind of oscilloscope and frequency sorter.

>> You need protection. You need an Evidence Eliminator.
Is there an Atari version, arsehole!.

Even the pc version is an illusion because of isp backups and police tools. Fortunately regular porn isn't illegal.

Hi!

I've been using about two scheme implementations during my studies.
I'm sure you can find some other lisp engines out there. Maybe you can
just try to compile some free sources. I'm pretty sure that a port of
this would be quite easy.

regards

STan

Well if you know how to use XBIOS you are (almost) done.
See: http://www.mbernstein.de/atari/prog/tos/xbios/0a.htm (very good docs I think)
It is in German so if you have translation problems do tell me or ask the author to do an English (or French) version!

> I'm beginning to programm in 68060 and need to drive a CD audio.

Mhhmm... Think you had better code for 680x0 before using pipeline and reordering tricks! Anyway MetaDOS sure does not benefit from this...
BTW how is your game going? Raytraced images are nice but I would be very pleased to see something more... concrete! ;-)

I think this doc will also be useful to you:
ftp://ftp.uni-muenster.de/pub/atari/Programming/cdbind01.zoo
(In C but you should figure it you easily anyway.)

> find a programm that can turn 640x200x256c pictures into a flh (programm not
> yet found). If I can't get it we'll do all by ourself as a good coder joined
> us and is making a programm to turn graphic card images into f30/TT screen
> compatible.

For assembling pictures into an FLH, all you need is here:
http://perso.club-internet.fr/vanel/flxwork.htm
(Well only TGA/TG1 is supported but no big deal I think, use XnView's
converter if needed.)

> Contact us as you want at jeu.tos@online.fr.ARETIRER

For all non-French people out there: jeu.tos@online.fr.REMOVETHAT :-)
Mhhmm, IMHO this type of fake adress should be quite easy for spam
bots to remove anyway...

Salut Guillaume,

𝍐> I'm nearly finishing a bloc move routine using 68040/60 functions and it
𝍐> should be rather fast.
𝍐move16, eh?

You won !

𝍐I think this doc will also be useful to you:
𝍐ftp://ftp.uni-muenster.de/pub/atari/Programming/cdbind01.zoo
𝍐(In C but you should figure it you easily anyway.)

I will try, ne not sure to understand it : I know GFA, I beginn in assembler
and that's enough for me.

𝍐For assembling pictures into an FLH, all you need is here:
𝍐http://perso.club-internet.fr/vanel/flxwork.htm

I tried it (and will try again) but even if it is written that it is free now I
experienced shareware restrictions)-:

```
>> Contact us as you want at jeu.tos@online.fr.ARETIRER
>For all non-French people out there: jeu.tos@online.fr.REMOVETHAT :-)
>Mhhmm, IMHO this type of fake adress should be quite easy for spam
>bots to remove anyway...

Sure, its why I wrote ARETIRER instead of removethat (-;

Sponsors announced for Jagfest 2002

For Immediate Release:
June 14, 2002
```

The organizers of The Sixth Annual Jaguar Festival (dubbed Jag fest 2k2) are pleased to announce
the current line of sponsors:

Atari Jaguar Directory:
an online directory listing of Atari Jaguar owners from around
the world. E-mail: Randy@atarijaguar.net
Website:http://atarijaguardirectory.com

The Game Trader:
A St. Louis area video game dealer that sells classic and
contemporary consoles and games. Located in St. Charles, Mo.,
at 2 Hawks Nest Plaza.
Directions: Directions: I-70 to Highway 94, south to the South Outer Road.
Turn right (west), go one half mile from 94 to Hawks Nest Plaza at the
Hawks Nest Drive overpass. Phone:1-636-723-0072.

Good Deal Games:
An online video game retailer that provides games for classic and orphaned
systems. Their website also provides information on video gaming past.
Michael Thomasson, President
Website: http://www.gooddealgames.com

Songbird Productions:
An online video game retailer and developer of Atari Jaguar and Lynx games.
Their store also hosted the third Jagfest in MN.
Carl Forhan, President
Website: http://www.songbird.atari.net

Telegames:
An online retailer and direct mail of video games for various game systems.
They also develop Atari games for the Jaguar and Lynx like Zero 5,
Breakout 2k and Worms for the Jaguar and Dessert Strike for the Lynx.
Telegames was also one of the first sponsors of Jag fest.
Address: Telegames, PO box 1855, Desoto, TX 75123
Phone: 1-972-228-0690 E-mail: Sales@telegames.com
Website: http://www.telegames.com

Trade n Games
1057a Gravois Road, Fenton MO. 1-636-349-3113. Trade n Games is
located on the bluffs off Gravois (the s is silent) overlooking
Fenton, Mo. Reseller of video games from Pong to Gamecube.

If you represent a business that would benefit from advertising in the
Jagfest program or appearing
in the festival's dealer room to sell your product or offer live
demonstration,
e-mail Greg George at greg@ataritimes.com or
JT August at starsabre@att.net for additional details and a pricing
schedule.

For more information On Jag fest 2k2 e-mail Greg George at
greg@ataritimes.com, James Garvin

at omc@omcgames.com, Daniel Iacovelli at atarivideoclub@yahoo.com or JT August at
starsabre@att.net or visit the Jagfest 2002 site at
http://omcgames.com/jagfest

(be sure to visit the Jag fest message board and post your ideas for this event.)

Folks,

I know this is probably a stupid question, but it is late and my brain has completley siezed up.

I am using the old GULAM shell and an old GCC (2.1.2) on my STE with TOS 1.6. I have copied some code from elsewhere. It "Makes" fine on my PC under CYGWIN with the latest GCC but on the ST it won't as it says the command line is too long. Are there any work arounds for this, or will I have to put some of the defines into a ".h" first?

Thanks in advance,

Dave

Hi Dave,

𝒆 I know this is probably a stupid question, but it is late and my brain has
𝒆completley siezed up.

We all are like that one day or another.

𝒆I am using the old GULAM shell and an old GCC (2.1.2) on my STE with TOS
𝒆1.6. I have copied some code from elsewhere. It "Makes" fine on my PC under
𝒆CYGWIN with the latest GCC but on the ST it won't as it says the command
𝒆line is too long. Are there any work arounds for this, or will I have to put
𝒆some of the defines into a ".h" first?

I won't help you a lot but is your programm made for plain Tos or Mint ? If Mint
long filenames are ok.

By the way, there maybe some interesting things for you (gcc last release and
free libraries to compile for any Atari, including 68060) at
http://olivier.landemarre.free.fr

Regards

Its not the file names that are too long. Make just builds a very long
command line with many
"-D" entries which I guess should really be in something called "config.h"
or similar and we should
have a "make config" to set it up.

Hi Dave,

𝍐Its not the file names that are too long. Make just builds a very long
𝍐command line with many
𝍐"-D" entries which I guess should really be in something called "config.h"
𝍐or similar and we should have a "make config" to set it up.

I just remember that when I have to pass long command lines to a .ttp I just run
Gemini (v2 ?).

Indeed it is :-)

>contains a file "strings.ttp" that AFAIK works under plain TOS or
>MagiC too...

Extracting strings is one thing (I can do this with Look'n'See), but there must also be a solution for "posting" text back in.

Cheers

Derryck

There is one on my page that I found. Not sure it's the most current
but it's better than nothing. ;-)

You can find it here:
http://www.q1.net/~atari/html/gfa_docs.htm

Thanks for the link I will check it out, I actually managed to sort of
achieve what I was trying to at the weekend by saving the images to a
sequential file and then loading them from the file into data
elements. Damn it displays them quickly on a Falcon, the only draw
back was that for the 10 frames I tried the file was over 1 meg and I
really need 30 frames!.
I will check out the info in stosser, I'm sure thats a better method
unless I can find another way of doing it.

I'm a little rusty but will try to help you. If you just want to store images in a bank then I think the missing link extension allows you to store more than 1 image in a bank and recover it. If you want to put it in there yourself then you want something like..

```
reserve as data 10,32768*5  ( 5 full screen images )
load "pic1.pi1",start(10)
load "pic2.pi1",start(10)+32768
load "pic3.pi1",start(10)+32768*2
load "pic4.pi1",start(10)+32768*3
load "pic5.pi1",start(10)+32768*4
```

then all 5 pics will be in bank 10. then all you need to do is use COPY to copy the block back from the bank to the logical screen. The missing link has a much better version of COPY (i think).....you would use something like....

```
copy start(10)+(32768*PICNUM),logic
```

I can;t remember the syntax offhand, screencopy *should* also work since you are storing valid image data in a bank. PICNUM is the number of the pic you

want to display on screen.

Once you get the hang of that idea you can then use the STOS Squasher or even Atomic to compress them and store them in compressed form in the banks to save space ;) I wouldn't use the screen banks to store images, its a bit limiting really, but fine if you only want a few images.

> Alternatively does anyone know how to get STOS to run IFF animations
> created by Delux Paint?.

erm, I think there was, I would check out STOSSER im sure its in there somewhere!

Hey everyone,

Octopus is a PureC project and so it compiles under PureC. The dilemma starts with the fact that after implementing STiNG support, I now want to implement mintnet sockets support. Which is all good and great but that would require getting the project to compile under GCC. I think that is probably a rediculously daunting task, however I think the alternative of getting it to compile under purec with the mintlib headers and libs would be easier. Any ideas on how to do this?

thanks
Mark

Going from gcc to PureC can be a bit tough, since it's not always easy
to get things to work with 16 bit integers if you started out with
32 bit ones. Also, if you happened to use any gcc specific features,
those are most likely not available in PureC.

The other way around is a lot easier, especially since gcc can be told
to use 16 bit integers using a command line switch (at least the
versions I have used supported that, but newer ports may have removed
the possibility) if you want to.

You may need to use a few different include files and add some #if
here and there, but unless you have used something strange in the
libraries, I don't think you'll have much trouble.

I usually make my software (including MGIF, which is about 1 Mbyte
(mostly C) source code (probably 50k lines or so), and fVDI (for which
the assembly files still don't work with gcc, so I'm not 100% sure that
the C code compiles correctly with it yet) which is of similar size
(but with a much larger percentage of assembly)) compile under all of
PureC, Lattice C and gcc, and seldom run into any problems.
When I do, it's because of those silly 16 bit integers.

The size of the type (int) itself can easily be worked around using
'long' where appropriate, but some constructs in the C language (at
least in PureC, I haven't checked the standard) can be troublesome
since they only work with 'int'. This seems to be the case with
'switch' and possibly array indexing (not sure about the latter, but
I seem to recall having some trouble with that earlier), for example.
Since your code starts out working under PureC, those problems should
not affect you.

Anyway, gcc is a much better compiler, so you're better off with it,
if you can take the compilation speed hit (can easily be ten times or
more slower than PureC).
The compilation speed is one good reason to make your code compile

with different compilers. Another is that different compilers tend
to catch different problems in the code (if you have access to
something like 'lint', that is of course much better still, though).

Hello everybody,

After vain tries, I call again for help :

We make a game : graphics and separate audio. Audio part had to be played via
the CD.

We found some CD instructions but in C, and we understant only Gfa and assembler

Can anybody tell us how to send 'play track X', 'pause', 'stop', and adjust sound
level (optionaly left and right if possible) via gfa or assembler ?

Regards

Yes, lots but none are particularly satisfactory.

a)
Locate an existing PureC port of the mintnet libs. I assume none exist
otherwise you would not have posted.

b)
Produce a PureC port yourself. If my assumption (a) is correct then it
will be reasonable to conclude that attempting to do so will require
substantial effort.

c)
Port a subset. You can get a good idea of what will be involved by
putting all the required calls into a gcc test app and getting the
linker to fail. Just list the calls - they don't have to make sense

but don't omit one because if you later need it the whole thing could mushroom out of control. Once it compiles and links cleanly, remove the mint libs for which no PureC equivilent exists. The resultant undefined labels will be pretty much what you will have to port to PureC. Whilst the amount of (mint) socket code (to be compiled by PureC) is an issue, the crux between feasibility and impossibility lies here...

I would imagine those undefined labels will go pretty "deep" into mint itself which is exactly what you *dont* want to discover. If this is the case then all you can hope for is those "deep" mint calls manifest themselves as traps - those being trivial to implement.

d)
Find a tool which can produce a PureC lib from a gcc one. Again, if one exists, it would be a stopgap measure: you at least would absolutely require source code for it (if for nothing else but to keep that tool working if the gcc format changes).

e)
Write a separate gcc app to hold the mintnet code. Have octopus(PureC) talk to it in some fashion - perhaps via a pipe.

f)
There's a STiNG "thingy-wotsit" (?gluestik?) for mint isn't there? I assume that idea has been dismissed.

I agree with Johan - port it to gcc. I might even be able to offer a helping hand in that respect but...

Is the C too large to post here?

I personally haven't a clue! If nothing else works perhaps you could
get a C compiler to translate it to assembler for you?

Hmmm, it has been some time but this may help, it is just an extension on what was said.

Think about the fact that a screen is exactly 32000 bytes, I think the rest is just palette on a PI1 and palette plus colour rotation/change on a NEO. Assuming each screen has the same palette then it is not a problem as it can simply be loaded before you start displaying, if not you can mask them off and put them into another bank and change the colour palette with each new frame.

The point being, if this is done then you only need to change the screen address each VBL and not to have to copy the screen into the LOGIC area, it can simply be replaced with;

```
reserve as data 10,32000*5
load "pic1.pi1",start(10)
load "pic2.pi1",start(10)+32000
load "pic3.pi1",start(10)+32000*2
load "pic4.pi1",start(10)+32000*3
load "pic5.pi1",start(10)+32000*4

for PICNUM = 0 to 4
    for FPS = 1 to 5
        wait VBL
    next FPS
    physics = start(10)+(32000*PICNUM)
next PICNUM
```

This should produce a simple animation at 5 FPS, it will only last a second with 5 frames (increase the FPS loop to make it last longer). I can not find my STOS book but I think that you need to put a SCREEN SWAP command or something similar after the "next FPS" but you will have to look into that yourself.

The only advantage this has is that the COPY command is removed, this will free a massive amount of CPU time. The only problem with this is that you may have to a line the BANK to 16bytes (I think) as the STFM Shifter is not that great, if the screen looks very wrong then this is the problem - can anyone help with this?

32K images by 30 odd images will be a lot of RAM (well 960K), you will be lucky to get it into a 1mb machine. As the other chap mentioned, STOS supports compressed images, a 32K image will go down to 4-5K or so, this means that you should be able to go from 30 frames to 210, at 12 FPS you will get 17 seconds or so on a 1mb machine. I do not want to go into that any more as I can not remember it, there is also a lot of optimising that

can be done in all of this too, I think you can compress just sections too
so you can change your screen to say 160x120.

I have lots of STOS code about with Demos in mind, none of it released but
you may be interested. I also spent much time optimising code in STOS and
there is lots that can be done. Mail me if you want to look over stuff
(stuff@recycledsteel.co.uk).

Free porn!!

If you will burn Bruce's fog before desks, it will eerily taste the kettle.
What did Sharon play the disk behind the lost poultice?

porn smut teen babes girls cunt twat pussy anal
As incredibly as Ibrahim helps, you can improve the diet much more badly. Garrick's frame teases inside our pin after we believe without it. A lot of young kind bandages happily solve as the hollow sauces behave. No sick dog or doorway, and she'll locally answer everybody. If you'll call Ahmed's autumn with grocers, it'll truly play the weaver. How does Said fear so subtly, whenever Aslan departs the filthy lentil very wrongly? If the rich disks can dye grudgingly, the rural frog may care more corners.

They hate noisy hats, do you mould them? Some buckets lift, pour, and nibble. Others surprisingly excuse. Yesterday, go grasp a desk!

No boats will be elder old bowls. Tell Felix it's urban walking throughout a floor. These days, it moves a paper too cold inside her angry lake. Her painter was outer, light, and promises under the morning. We clean the blunt tailor. The goldsmith near the sweet kiosk is the shirt that explains undoubtably.

Who wastes fully, when Bert irritates the open puddle beneath the sign?

Are you blank, I mean, killing for upper ointments? Will you taste around the hill, if Darin annually recollects the pitcher? They are ordering without the college now, won't learn figs later. Many younger think game changes cans among Simon's fresh raindrop. It joined, you climbed, yet Kareem never dully attempted beneath the evening. Plenty of clean eggs are sour and other rude cups are stupid, but will Elmo converse that? Get your tamely loving unit behind my ocean. How doesn't Rasul cover cruelly? Let's kick at the stale squares, but don't smell the raw cases. Other polite weird doses will attack quickly under lemons. Why will you dream the cosmetic clever films before Rasul does?

He might judge smart ulcers alongside the dull worthwhile light, whilst Zakariya deeply looks them too. Better burn spoons now or Alhadin will hourly fill them for you.

I was seeking to comb you some of my fat bushs. While shoes sadly irrigate plates, the cars often reject for the dirty aches. Feyd, without caps durable and sticky, creeps over it, laughing stupidly. It's very closed today, I'll shout finitely or Said will wander the jugs. Sometimes Sadam will arrive the gardner, and if Jeremy wistfully cooks it too, the ticket will receive about the wet house. The difficult onion rarely likes Sayed, it scolds Osama instead. If you will recommend Tommy's hallway around drapers, it will stupidly live the carpenter. For Susie the porter's handsome, above me it's full, whereas in front of you it's measuring short. Lots of humble printers open Said, and they eerily expect Dick too. When did Waleed sow alongside all the potters? We can't jump counters unless Haron will strangely talk afterwards. No shopkeepers halfheartedly lift the unique

hall.

They globally mould between deep pathetic drawers. Catherine cleans, then Said gently pours a active orange near Doris's sunshine.

It should join weekly, unless Sadam helps butchers in back of Ibraheem's carrot. What did Anastasia order the wrinkle for the bizarre candle? Tomorrow, Alfred never converses until Angela burns the good button wanly. Otherwise the kettle in Sarah's ball might like some quiet exits. Where Hassan's bitter tag calls, Raoul learns alongside ugly, strange ladders. He'll be tasting near thin Allahdad until his poultice changes furiously. Lakhdar, still departing, believes almost freely, as the cat scolds under their teacher. Don't try to nibble the tapes inadvertently, recommend them crudely. He might generally waste lazy and attacks our lean, easy pears below a stable. She can reject the proud fork and excuse it around its satellite. Try arriving the structure's poor smog and Blanche will fill you! It can cover loudly if Owen's pumpkin isn't lower. Rasul! You'll kick books. Hey, I'll explain the pen.

Said wanders the elbow with hers and believably pulls. Fucking don't attempt eventually while you're looking throughout a sad jar. Don't try to creep a envelope! Both dying now, Norris and Claude judged the dark bedrooms for healthy twig. To be distant or bad will sow inner enigmas to weakly hate. The coconuts, tyrants, and powders are all hot and heavy. Yesterday, walnuts shout with wide planets, unless they're solid. You won't jump me improving over your empty monument.

I am slowly dry, so I love you. I was solving coffees to glad Yosri, who's caring against the barber's stadium.

They sneakily receive without Ahmad when the long stickers tease beside the cheap swamp.

Hello,

I recently read the M⍰tados doc and read about FOUR s⍰parate audo tracks on audio CD.

Does anybody knows how to extract or write them s⍰parately ?

Regards

Thanks Guy.

Here is the C, I don't know to translate it in xbios function that I can use in Gfa or assembler.

    CD-ROM Fcntl()s and structures

Copyright (c) Julian F. Reschke (jr@ms.maus.de), 16. Mai 1994
Free distribution and usage allowed as long as the file remains
unchanged.

These Fcntl() opcodes provide a *nix-like interface to the CD-ROM specific functions. They can be used either with a MiNT specific CD-ROM device driver or with new MetaDOS BOS lowlevel drivers. For MiNT mounted device drivers, the interface is

```
    Fcntl (short filehandle, short opcode, long arg)
```

(with filehandle a handle to the opened CDROM device driver) or

```
    Dcntl (short opcode, char *name, long arg)
```

(with name being the name of a file or directory on the mounted CD file system).

For MetaDOS BOS drivers, the interface is

```
    xbios (0x37, short device, long magic, short opcode, long arg)
```

where 'device' is a MetaDOS XBIOS device number ('A'..'Z') and 'magic' is 'FCTL'. With MetaDOS version >= 2.40 and the appropriate DOS drivers, you can also use the GEMDOS call Dcntl (thus being compatible to future MiNT drivers), because MetaDOS 2.40 implements some of the new GEMDOS calls and Atari's ISO9660F.DOS passes all Dcntl calls right down to the BOS driver.

Note that there is an 'old' CD-ROM audio interface for MetaDOS, but the commands depend on the custom CDAR 504 controller and can't be fully implemented for SCSI drives (in fact they are, with some restrictions). Consult the MetaDOS developers manual for further information.

In both cases, EINVFN (-32L) is returned for unknown opcodes.

Note that MetaDOS drivers return EUNKNOWN (-3) if XBIOS opcode 0x37 is not supported!

Drivers supporting this interface (send updates to jr@ms.maus.de):

MetaDOS BOS drivers (driver name, company):

```
 HS-CDROM.BOS
      Hard &Soft, Castrop-Rauxel, Germany
      Generic driver for SCSI-CDROMs connected to ACSI or SCSI and
      for the CDAR504

      FX001???.BOS, CDU33???.BOS
           Gellermann & Fellmuth GbR, Berlin, Germany
           Drivers for Mitsumi drives connected to internal or parallel
```

```
              interface.

    MiNT device drivers (driver name, company):
        -

I have no idea how Fcntl() and Dcntl() are implemented. Oh, hang on Fcntl() is gemdos(0x104,...) according to the Compendium - and Dcntl() is gemdos(0x130). If nothing's changed since then see below...

```

```

In Mark Williams C I recall that xbios(), bios() and gemdos() are simple asm wrappers. The arguments are pushed right to left then the corresponding trap call is made. Something like this...

```
move.l arg,-(sp)   //4
move.w opcode,-(sp)    //2
move.l magic,-(sp) //4
move.w device,-(sp)    //2
move.w #$37,-(sp)  //2
trap 14
adda 4+2+4+2+2,sp
```

Rooting around in MWC I find it does it generically thus (strange asm syntax in mwc)...

```
/
[snip copyright] ahem! ;-)
/
/ Xbios call function
/
     .bssd
0:   .blkl    1
     .shri
     .globl   xbios_
xbios_:  move.l   (a7)+, 0b     / Get return address
     trap $14           / Do call
```

```
     movea.l  0b, a0             / Restore registers
     jmp  (a0)          / Return

>        BYTE  reserved, minute, second, frame;
>    } msf;
>    long lba;
>} cd_ad;
```

A union is "two things mapped onto the same space". This means that all of 'reserved,minute,second,frame' are crammed into 'lba' (and vice-versa) but unfortunately C has little to say on how this is accomplished. One would hope that 'lba' takes 4 bytes of storage and that 'BYTE' is defined to *be* a byte _and_ that the compiler will generate code that can pack bytes.

In reality, one would hope/expect that an atari compiler would generate code such that...

```
cd_ad.lba = 0x12345678;

...causes...
cd_ad.reserved to be 0x12;
cd_ad.minute to be 0x34;
cd_ad.second to be 0x56;
cd_ad.frame to be 0x78;

...and that if you then added code that caused...
cd_ad.minute=0xfe;
...then a subsequent read of...
cd_ad.lba yields 0x12fe5678;
```

I think the asm would go like this...

```
lba:
reserved: dc.b 1
minute:       dc.b 1
second:       dc.b 1
frame:        dc.b 1
```

```
> Data structures used
>
>struct cdrom_msf
>{
>    BYTE    cdmsf_min0;      start minute
>    BYTE    cdmsf_sec0;      start second
>    BYTE    cdmsf_frame0;    start frame
>    BYTE    cdmsf_min1;      end minute
>    BYTE    cdmsf_sec1;      end second
>    BYTE    cdmsf_frame1;    end frame
>};
```

We ought to expect...

```
cdmsf_min0:   dc.b 1
cdmsf_sec0:   dc.b 1
cdmsf_frame0: dc.b 1
cdmsf_min1:   dc.b 1
cdmsf_sec1:   dc.b 1
cdmsf_frame1: dc.b 1
```

```
>struct cdrom_ti
>{
>    BYTE    cdti_trk0;       start track

```

No doubt you can do the above two yourself now.

```
>struct cdrom_tocentry
>{
>     input parameters
>
>    BYTE    cdte_track;      track number or CDROM_LEADOUT
>    BYTE    cdte_format;     CDROM_LBA or CDROM_MSF

>                                    bit 1: digital copy permitted,
>                                    bit 2: data track,
>                                    bit 3: four channel
>    BYTE    cdte_datamode;       currently not set
>    cd_ad    cdte_addr;              track start
>};
```

The 'colon' denotes a bitfield. A nice idea in C but the implementation (worse than union) is so vague as to make portability impossible. It isn't even consistent across the atari compilers, let alone different platforms.

'unsigned' is the same as saying 'unsigned int'. The amount of bytes required to store 'int' depends on the compiler. With the atari we're looking at either 2 or 4 bytes. Discover which compiler this code was written for and someone will know for sure. Loosely (and iirc)...

```
MWC  2 bytes
PureC    2 bytes
Lattic   4 bytes
GCC  4 bytes
```

...but compiler options can change that: eg "-mshort" option on gcc yields 2 byte 'int' (I *think*).

In order for us to proceed I'm going to say 'unsigned' happens to be 2 bytes. No reason for that decision except I felt like it. Okay, back to bitfields...

If the above were this...

```
unsigned cdte_adr:4,
      cdte_ctrl:4;
```

...then (don't memorise the next paragraph - I mention it only in case you come across it)...

The compiler may (because it's allowed to) use two separate 'unsigned' storage positions for the above (for performance against alignment). One would expect both the above to be merged into a single 'unsigned'. In fact as 'cdte_adr' is 4 bits and 'cdte_ctrl' is 4 bits then they'll even fit into a single byte. However *that* (pack into a byte of storage) should not occur: this is because the declaration is 'unsigned' therefore a whole 'unsigned' of storage will be allocated (even if both get packed into one byte and the other byte gets wasted). Er, forget this bit - it would require an essay!

Luckily things are a little less complex...

```
>    unsigned    cdte_adr:4;      the SUBQ channel encodes 0: nothing,
>                                     1: position data, 2: MCN, 3: ISRC,
>                                     else: reserved
>    unsigned    cdte_ctrl:4;     bit 0: audio with pre-emphasis,
>                                     bit 1: digital copy permitted,
>                                     bit 2: data track,
>                                     bit 3: four channel
```

...because both declarations are declared separately. This means 'cdte_adr' will take a whole 'unsigned' of storage and 'cdte_ctrl' will take another 'unsigned' of storage. So we have...

...either...

```
cdte_adr:dc.w 1
cdte_ctrl:    dc.w 1
```

...or...

```
cdte_adr:dc.l 1
cdte_ctrl:    dc.l 1
```

...depending on the compiler that got used by the author. Also dependant on the compiler: which 4 bits are getting used? Judging from the comments, then bits 0..3 seems certain - but do bear (vaguely) in mind that C compilers can store these bits anywhere in 'unsigned' that they feel like.

Assuming the above...

```

>#define CDROM_LBA   0x01
>#define CDROM_MSF   0x02
```

You probably know, but '#define' is a constant - compiler simply replaces the textual name with the value then compiles it (EG: "add CDROM_LBA,d0" is effectively "add 0x01,d0").

```
> SUB Q control bits
>
>#define CDROM_AUDIO_EMPHASIS    0x01
>#define CDROM_COPY_PERMITTED    0x02
>#define CDROM_DATA_TRACK        0x04
>#define CDROM_FOUR_CHANNEL      0x08
>
> The leadout track is always 0xAA, regardless of # of tracks on disc
>
```

```
>#define CDROM_LEADOUT   0xAA
>
> return value from READ SUBCHANNEL DATA
>
>#define CDROM_AUDIO_INVALID     0x00     audio status not supported
>#define CDROM_AUDIO_PLAY        0x11     audio play operation in progress
>#define CDROM_AUDIO_PAUSED      0x12     audio play operation paused
>#define CDROM_AUDIO_COMPLETED   0x13     audio play successfully completed
>#define CDROM_AUDIO_ERROR       0x14     audio play stopped due to error
>#define CDROM_AUDIO_NO_STATUS   0x15     no current audio status to return
>
> CD-ROM Fcntl opcodes
>
>Get block number of first sector in last session of a multisession CD. Argument
points
>to a LONG. Used by iso9660f.dos
>#define CDROMREADOFFSET     (('C'<<8)|0x00)
```

A constant again, albeit a more complex one. Same procedure - replace the name CDROMREADOFFSET with the "value" '(('C'<<8)|0x00)' because that's exactly what the compiler does then it comes across it.

The '<<' is a bitshift and the single quoted 'C' denotes a character, which on the atari will be stored in a byte. Shifting a byte 8 times is not healthy but it does work in C because '8' is an 'int', and for the most part the compiler will promote datatypes up to the largest one used in an expression. Thus it turns 'C' into an 'int' (2 or 4 byte and irrelevent here) then shifts that 8 places yielding either 0x4300 or 0x000043000. I'll assume two bytes again 'cos it's less to type!

The '|' is a bitwise OR (as opposed to a logical OR).

So we have

```
 'C'   (0x43) [move.b 'C',d0]
 <<8   (0x4300) [ext.w d0] [asl.w #8,d0]
 |0x00 (0x4300) [or.w #0x0000,d0]
```

Note that a C compiler can resolve these at compile time. No runtime calculations required. Simply work out the values yourself then use them directly...

```
>Pause audio operation
>#define CDROMPAUSE          (('C'<<8)|0x01)
```

0x4301

```
>Resume audio operation
>#define CDROMRESUME         (('C'<<8)|0x02)
```

0x4302

```
>Play audio. Argument points to cdrom_msf structure
```

```
>#define CDROMPLAYMSF        (('C'<<8)|0x03)

[etc]

Some months ago I posted a question about Powerpoint file formats.
Anyway to cut a long story short my isp isn't forwarding posts so
no-one ever saw the question.

I later discovered that m$ doesn't release info about PPT files
so I set about dismembering a few files.

I have so far produced a script for the TUC (The Ultimate Converter)
that produces an RTF file containing all the text from the slides
plus some other random text. It's is then easy to edit the RTF in
Papyrus.

I have also written a PurePascal program that extracts PNG and JPG
images and WAV sounds from within the PPT file. It may work with
other files but I haven't tried it.

Both the script and the PurePascal program are Alphas but if anyone
is interested then drop me an e-mail (remove the spam preventer)
and I will send you the code.

As a side issue TUC runs ok on the Milan (NAES) but the text sent
to the screen is rubbish. Does anyone know why ?

Regards,

Peter

With it you will be able to compile for any cpu included 68060, but I
left it behind because of the unfriendly interface (my opinion).

You can jugde by yourself by using the best interface for gcc at :
http://olivier.landemarre.free.fr then look for GCC interface.

@what is the best hand assembler for falcon?

Did you had a look at devpac 3 ?

Regards

Please let me know if this version of this compiller does know how to build
68030 and 68881 specific code. Or is it a generic ST compiller?

Thank you, fellas.

Wow, stop, another thing: what is the latest DEVPAC version for Falcon? And
where can I download and/or buy (cheap) one?

Cheers!

AFAIK Lattice stopped in 1994 at v5.60 (basically a "Falcon upgrade"
to v5.5x)

Yes, v5.60 can compile 32-bit code for the '020 and '030, and can also
generate code for the '881 and '882 FPUs.

(I cannot recall if it can also do '040 code, as I've never needed to
do such code, as the best Atari I've owned is a TT with an 030 and
882)

In fact version 5.06 (the first version of Lattice I owned in 1992ish)
could do this as well. However 5.06 was not the "all in one"
environment that 5.60 (and 5.5?) are.

> Wow, stop, another thing: what is the latest DEVPAC version for
Falcon? And
> where can I download and/or buy (cheap) one?

Devpac/Atari stopped at version 3.10 in 1994.

It can handle code up to the 68040 (MMU, FPU included)

(BTW: I assume you know that Lattice includes an assembler - but is
suitable only for creating assembler code modules within an app. For
assembly-language-only apps, Devpac is better _and_faster_ and can
generate Lattice object modules if needed)

Thank you, good human! ;)

Another question for you:

I am looking to buy an FPU for my Falcon. Best electronics have both 68881
(50$) and 68882 (60$) in LPCC package. The difference in price in minimal,
and 68882 is more advanced (i.e. can bee hardware hacked to operate at
50MHz). So I was considering 68882. But recently I came across info what
with 68882 Falcon won't run certain ST apps, which it can run smooth with
68881...

So now I'm in doubt, which FPU should I go for...

I think I'll post this question in comp.sys.atari.st as well. May be good
folks will give me some bright ideas for my choise ;)

Unfortunately I can't help but I have a question of my own...

How are you building SDL - environment, options etc?

I've recently noted that SDL looks interesting but sadly it considers
cygwin==mingw thus it may be very helpful to have another compilation
target to test my changes against (ie Frank's cygwin m68k).

This is from memory so I could be wrong but.....

Only the TT and Falcon had FPUs commonly, the MSTE and other had some hacked ones but they are rarely installed and so it would not matter (they used strange calls, etc), if your code is made compatible then it would only open up for a few extra people.

I managed to get a 50Mhz FPU (68882) from e-bay for only $14, this will run at 60Mhz no problems. The 16Mhz will only run at 25Mhz maybe and a 33Mhz at say 40Mhz (these are guesses).

The 68882 are much quicker, I think they do all instructions in one cycle.

Maybe you could do two binaries, one with and one without FPU.

CPU, FPU and DSP speeding hacks are easy to do and available all over the place. My falcon runs at 25/50/50 at present (a Phantom upgrade). I have a 60Mhz crystal which a plan to install, I have tried it with all chips (i.e. 30/60/60) but no joy, I am sure it will work with the DSP and FPU but I will have to bypass some of the Phantom bits (i.e. 25/60/60). I think the CPU will run faster but I believe the problem is the Atari chip that controls most of the BUS, I think it runs at 4x the CPU speed (i.e. 100Mhz) and it can not keep up with it.

Does this sound right to people or I am talking bollocks?

Also, if this is right, can the BUS chip be replaced by something else?

One more thing, what speed is the Videl running at with my above? Can that be boosted more it would it make no sense to?

Elliot...

>The 68882 are much quicker, I think they do all instructions in one cycle.

The '882 is not much quicker than the '881 at all. I have never heard of a reason to take the '881 over the '882, though, so you might as well get hold of the latter and earn a few cycles here and there.

No FPU that I've ever heard of, outside the DSP domain, does _anything_ in one cycle (while it would certainly be possible, it would have a tremendous impact on the clock speed (which is one reason why many DSPs clock much slower than contemporary general purpose CPUs)). The FPU in a modern CPU can have a through-put of one cycle for many operations (and might even do that for several types of FPU instructions at once), but that is quite another matter.

In any case, the '882 is _very_ far from that kind of speed. Generally, it is somewhere around 5-10 times slower than the '040 FPU, clock for clock (for the operations that they have in common).
Something as simple as a register to register move, or an add, takes more than 20 cycles on the '882 (2 and 3, respectively, on an '040), multiply is 70ish (5 on an '040) and division (38 on '040) and square root 100+ cycles (sqrt is 103 on the '040).

So, while the '882 is certainly a whole lot faster than doing FPU operations on the '030, it is extremely slow for most normal things even by '040 standards.

Hi, apologies if this is dead obvious.Only recently got a falcon and
trying to figure out my way round the atari os again after 11 years
away.

What it is, is that in future, I'll be getting zero-X, which is an
audio program that can handle wav files. Very useful to ba able to
transfer between my PC and falcon, on the same disk (and my sampler
too for that matter).

Also, all the software I'm currently getting, off the net, it's a bit
of a ball ache transferring it onto floppy disk to go and put it on
the falcon.
Is there a way I can make both the Falcon and the PC read the same
iomega zip disk so that I can bump everything onto it and transfer it
over like that.

(For info purposes, I have HD Driver 8 which I'm using to format the
zip disks on currently)

Thanks if anyone can offer up some pointers... RJ

I believe that HDriver has that option. Have you checked the manual?

Indeed, a FPU in a MSTE or ST operates differently than in a Falcon or TT-
instead of a "co-processor" CPU-FPU mode in Falcon/TT (mode not available
on MC68000 CPU) , in a (M)ST(e) the FPU is operated as a "memory-mapped
peripheral". The two operating modes are not compatible and require different
code. Truly, there are not many applications that can use a memory-mapped FPU:
e.g. programs compiled with Pure-C or Prospero Fortran (and possibly Gfa-basic
with Licom library) can use it, Dynacadd uses it, and a couple of games and
astronomy programs. There is an emulator (by Henk Robbers) of the co-processor
FPU which uses a memory-mapped one, but, unfortunately, applications which
provide for co-processor FPU most often also assume that a MC68020 or higher
is used, and so can not be run on a MC68000 even with the FPU emulator.

However, there is nothing "hacked" in the mode a memory-mapped FPU is used.
It is a perfectly legal way to connect a FPU to a MC68000 CPU and it was
described in the MC68881 manual. The FPU operates asynchronously to the
CPU< a any desired clock rate. In a MSTE, installing the FPU was a simple
plug-in operation (provided that the address decoding GAL was already in
place; otherwise the GAL had to be plugged-in as well). For a ST or MegaST
there was a SFP004 FPU Board (by Atari, iirc). The circuit for a memory-mapped
FPU is rather simple (basically, an address decoder) and is quite within the
do-it-yourself range. An installed FPU gives a speed benefit on floating-point
operations between 500% and 1500%, depending on the application.

Hi Rob!

Yes you should be able to do that. There should be no need to format the Iomega - just partition it with HDDRIVER and make sure that in 'Compatibility' the 'Windows' radio button is switched on and the 'TOS & Windows combined' checkbox is crossed. Note that this will only work with a single partition, but that shouldn't be a problem in your case.

As you may have seen earlier in c.s.a.st, I use a similar arrangement with SyQuest EZ135, using an Adaptec USB<->SCSI adapter. Originally I was going to move the drive from one machine to the other, but I managed to get a second drive cheap and now have one connected to either computer, so only need to move the carts. I see no reason why an Iomega should be different.

Regards, /Peter/

I need image of ROMs (64KB) for TOS 0.98 (TOS RAM) and image of system disk.

Can you help me?

Thank you.

the earliest I've seen is the diskbased tos 1.0 (sometimes referred to as 0.98) there is no 64k tos roms, the earliest rom sets were 192k roms

the disk image is available on the net. From documentation I read
some time ago, the only functions it uses from the ROM are
rwabs() (read only) and getbpb().
Some TOS vars are perhaps needed too.
I don't see why the floppy image woudn't work on other 192k or even
256k TOS ROMs. (but I didnt test either).
Other (legal, open-source) ROMs do exist, that may be able to
boot the floppy. look for 'EmuTOS' on google.

Laurent.

Someone is working on that... he has them nearly complete.. I imagine he
will give them out as it will be quite useful for many people.

While PureC is nice in its way (fast compilation and a good source
level debugger), I don't think you can buy it new these days.
Of course, someone might be willing to part with theirs.

gcc on the other hand is a much better compiler, and is free.
It does take a lot longer (and more memory) to compile things,
though, unless you run it as a cross-compiler on a PC or something.

Beware of trouble with 16 bit integers if you intend to port code
from other systems to PureC, by the way.

Better yet, use "short" or "long" intead of "int" whenever possible.

From the very beginning, "int" was intended as the "I don't really
care how big it is" integer type. In the days of "all microcomputers
use int for 16 bits" (a quote from a C manual) we developed a bad habit
of using "int" instead of "short" (two fewer keystrokes).

Then for some unknown reason C compilers started translating "int"
as "long" (probably for the same reason Spinal Tap uses amplifiers
that go to 11 instead of 10). Since then I have become an advocate
for "int free" code.

I've even been tempted to replace all the ints in the system include
files, but then my code wouldn't be portable to anyone.

How do I get the user name/details from within my programs?

Essentially, I want to be able to do a "whoami" from within my app
without doing a Pexec("whoami") and capturing the (redirected to my
app) results - is there a DOS/MINT/MINTNET system call available?

I envisage something like this:

```
    UserInfo userinfo;

    ...
    if( GetUserInfo( sizeof( userinfo ), &userinfo ) )  {
        if( strcmp( userinfo.name, "root" ) == 0 )
            do_something();
        else if( userinfo.group == supervisor )
            do_something_else();
        else if( userinfo.group == normaluser )
            do_something_normal();
        else
            do_something_boring();
    }
    ...
```

(Apologies if that mimics a W**tel system/call)

I'm using Lattice C 5.60 as my development environment running under Mint 1.15.9 (and some version of MINTNET I cannot recall) and AES 4.1 on a TT with UK TOS 3.05. I also have MemoryProtection turned on.

The Compendium doesn't seem to give that info (or am I just not reading it correctly?)

(Is there a MINT mailing list/group I should contact?)

Handy bookmark ;-)
http://www.rt.com/man

Looking at http://www.rt.com/man/getpwuid.3.html I believe this should
do the trick...

```
#include <iostream>
#include <pwd.h>
#include <unistd.h>

int
main()
{const struct passwd *const p(getpwuid(geteuid()));
cout<<(p?p->pw_name:"nowt")<<'\n';
return 0;
}
```

'whoami' appears to be nothing more than a wrapper for 'id -un' which
in turn looks as though it would be using geteuid() on getpwuid(). I
can't test it on MINT but it does work on Cygwin and when
cross-compiled using Frank's cross-compiler, the MagicPC demo yields
"nowt". In fact a MINT compilation would probably yield "nowt" on a
bog-standard ST because I can't see any reason why getpwuid() should
be doing anything more complex than parsing the password file. Perhaps
if "/etc/passwd" and "/etc/group" existed it may even return something
(?root?) on TOS?

>I envisage something like this:

>(Apologies if that mimics a W**tel system/call)
```

Someone else ought to chip in here, but... I'm not entirely sure checking for "root" is a good idea. I think you ought to do that particular test on the numeric id, which is always zero whereas I believe "root" can theoretically be changed (will still be zero though).

```
#ifdef __CYGWIN__
# define YE_OLDE_ROOT  18   //"root"=="SYSTEM"
#else
# define YE_OLDE_ROOT  0    //"root"==??
#endif

if (YE_OLDE_ROOT == geteuid())
     do_something()
else
if (userinfo.group == supervisor)
...
```

Yeah, Cygwin is an exception. I mention it just in case you ever decide to test under that environment and fall foul if it. There may be a proper "ROOT" macro but I dunno what it is - all the code I've ever seen that checks for root is using zero (pita to find!).

Hi All!

I'm trying to think about the $subj in terms of writing a MetaDOS
filesystem driver. Is the GEMDOS layer synchronized across the
processes? What I mean is whether I need to take care of
threadsafety of e.g. my Fread() replacement or not.
In SingleTOS this should be OK as long as only cooperative multitasking
is present. But what about MiNT or MagiC?

best regards

STan

Does anyone know somebody who sells Lattice C 5.6 new. I'd like to buy
a copy.

TIA

Check out 16/32 Systems (Nick Harlow)
http://www.1632-sales.zenwebhosting.com/acatalog/
16_32_Catalogue_Programming_15.html

He accepts credit cards and definitlely had it in stock this summer.

It's a complete C development package with almost everything you need.
There is no interpreter but a normal compiler, linker. An Assembler is
also included.

Comes on 7 floppies and manual in three volumes with a total of 1064
pages, indexes not included!

Hello,

Someone would have him of infos on differences between the RSC files of
type 4 (AES 3.40 and more) and those generated by Interface. Indeed for
one same RSC file, the size is bigger when it is generated by Interface
2.33. This is not true that at the time of the utilization of icons
color. I perceived of it at the time of the debug of my version 1.3 of
Icon Extract. At the time of a safeguard of two icons windows in 256
color, I generated a pure RSC file of type 4. In fashion TRUE COLOR,
Interface 2.33 displays him to me of it false colors whereas RSM
displays him to me correctly ! I did a to copy - paste to create
therefore on Interface a similar and there surprised file, there are
more 1500 bytes of difference! Thank you by advance of your help.

Florent

After another long delay I've started working on my spell
checker again. You can download the prototype from my web page.
Included is the proposed program interface docs, which I would
appreciate some feedback on. (OTOH, I'll probably be the only
programmer to make use of it, so I might as well do what is easy
for me.)

The main dictionary is in a separate file and took about an hour
to upload at 56K baud. It takes nearly 1 meg to store in RAM, so
anyone with less than 2 meg needn't bother.

Nice project John.

May I ask what happened to the English help file for PureC that's pointed to
on the Elfsoft web site though, it seems to be unavailable?

Cheers

It seems my entire FTP directory has disappeared!

Needless to say, I'm trying to find out what happened. (Maybe they
didn't like my new "Earthlink sucks!" page.)

Must have been down for a long time, I'd been trying to download this file for a couple of years. Someone in csast was kind enough to send me a copy though, so I will be glad to forward it to you in case it has become deleted somehow.

Cheers

The Industry's FIRST Virtual IMB WebSphere Innovation Center is Now Online
http://cgse3.cgselearning.com/

The V-WIC is a state-of-the-art knowledge portal that provides remote, online
technical training for WebSphere products and servcies. To meet the needs of
developers at various skill levels, the V-WIC combines self-paced e-learning
courses with Hands-On "e-labs" and "Live" online mentoring.

The site also offers a wide range of information and resourses on the
WebSphere family of products, and links to many other valuable resources.
Developers can take courses to gain proficiency in a range of WebSphere
technologies, address a specific technical problem, enhance exisiting skills,
or prepare for industry certifications.

We are offering FREE courses.

For that matter what does this person think any of us want with such courses.
Look at the newsgroups that pathetic little troll posted to. All of them are
for people who don't wnat to use ibm systems for their main preference (except
for a few who might use pc's on occasion for internet access)

Is there a way to environmental vars ? I know I have functions in MCMD,
mupfel, okami to set and change var values, delete (unset) or create
variables, and then call programs that use this new modifyed environment, but
is it possible to modify the "global" vars ? Is it really the only possible
way to modify MAGX.INF and reboot ?

If you only want to change the environment for child processes,
simply create a new environment in RAM and pass the pointer to the
child (using Pexec or shel_write). If you want to change the
environment for programs launched from the desktop, create the new
environment, put the pointer into system variable the_env ($4BE),
then Ptermres() to keep this environment in RAM.

For AES >= 4.0 N.Aes, XaAES and probably MagiC

shell_write(8,1,0,"NAME=value", 0L);

A already existing NAME will be replaced.
To remove a NAME omit the value. ie "NAME="

Nono, this is the simply way, I want to change the environment globally, I do
not know why this DOS concept does not apply to TOS.

 e> If you want to change the
 e> environment for programs launched from the desktop, create the new
 e> environment, put the pointer into system variable the_env ($4BE),
 e> then Ptermres() to keep this environment in RAM.

Ho yes I want, ehm can you also please tell me how should I create the new
environment ? Isn't it dangerous this allocate and give to the system this
new memory area ?

And here is the hot question, is there a program that does this ? I've never
seen this thing aroung, not as a utility program, not as a program function
nor as source code.... why ? I think each shell (Thing, MagiCDesk) should
include this function.

Sorry but this does not work, maybe it changes the local environment, not the global one.

Hiya,

All you oldskool 68K democoders might wanna check out www.mobilewizardry.com
We've set up a demo programming competition for all you 68K veterans out
there.
You can participate in 4 different categories;
- 256 byte intro's
- 1K (1024 byte) intro's
- 4K (4096 byte) intro's
- generic "show us what you got" demo's, which can have any size.

The demo's/intro's must be written for the Palm OS platform, with the
Palm m505 16-bit color handheld as a target device. Instructions on how
to obtain a developer kit and Palm emulator, can be found at
www.mobilewizardry.com

Cheers,

The MobileWizardry.com/Ardiri.com team

Hi!

Mike De.Petris <mike@bbsgate.interware.r.e.m.o.v.e.t.o.r.e.p.l.y.it> wrote:
> Nono, this is the simply way, I want to change the environment
> globally, I do not know why this DOS concept does not apply to
> TOS.

As far as I know, DOS neither has any system calls to manipulate the global environment, it can only be changed by issuing SET commands in the primary command.com, which is basically just a frontend to putenv(). Note, however, that this does not change the environment of already running programs.

> Ho yes I want, ehm can you also please tell me how should I
> create the new environment ? Isn't it dangerous this allocate
> and give to the system this new memory area ?

Don't do that. The method described is the way to set up an /initial/ environment under SingleTOS - MagiC, MultiTOS, N.AES and friends all allow specifying the initial global environment via their config files.

Using the exec_os vector after GEM has been started is futile, as this vector - as its name implies - is only used to run the primary OS once the boot process has finished.

> And here is the hot question, is there a program that does this?

Not to my knowledge, as it is practically impossible.

> I've never seen this thing aroung, not as a utility program,
> not as a program function nor as source code.... why?

See above. Furthermore, I don't see any need to be able to do it. You'll never be able to influence the environment of already running programs, anyway.

> I think each shell (Thing, MagiCDesk) should include this
> function.

What for? Most modern desktops (at least Gemini, Jinnee and Thing) allow you to specify local environment variables for individual programs. And the global system environment may be changed using the OS's config file - I don't see a need to dynamically change it at runtime.

Ciao

Thomas

> the global environment [...]

Just the note that it's already a bad idea to talk about a "global" environment, as there is no such thing. There's the initial environment, the "root" environment, if you want. All new processes either inherit the environment of their parent or have it explicitly set up for them, but they do not get a global environment.

In essence, processes run via shel_write() either inherit the AES'es environment (set up via the latter's config file, or - when using SingleTOS - via tools liks Senf) or get the environment specifically passed to shel_write().

For Pexec(), a new process inherits the caller's environment, or uses the one passed in the third parameter if it is non-NULL.

Ciao

Well, yes, it changes the environment of the AES, which is then
copied to AES clients started subsequently.

I have a feeling that the people who kindly replied to you misunderstood the question. Maybe you are looking for something like Pascal Fellerich's "Environment Manager" which consists of an auto-folder program AUTOENVR.PRG, an environment-variables file DESKTOP.ENV in the root of the boot drive, and an accessory (or program) ENVIRO.ACC which can be used to show, load/save (to file) or modify the values of environment variables for all programs subsequently launched. This pack can be found here and there on the Net, called ENVIRM23 or something like that. AFAIK there are other utilities that do the same as ENVIRM. If I remember correctly, a long time ago I tried several of them and found Pascal's one the simplest to use and most compatuible with anything.

Hey guys,

Since we have the sources to TelVT now, I would like to start or persuade somebody to start doing a couple fixes. Namely the scrolling code under MagiC at least causes it to overwrite anything else. You can't minimize or hide the window, it still writes everywhere all over the screen. Say for example if you have irc or top running and then try to top the window. I am not sure if it does this under MiNT or not, but it is certainly annoying.

The other thing is the fontselector which doesn't work at all for me, and is rather uhm... undesireable even if it did. Looking over the code I must say I can't even begin to figure out what the problem is.

Also telstar doesn't seem to support VT100 scrolling so stuff like irc doesn't work in there either. This is why I want telvt to work properly because it DOES support that.

So does anyone know where to start?

If it's clobbering the screen then the logic that handles the AES redraw is not quite right. I'd look there first.

Are there any developer tools still available or which you can
recommend? In particular I am particularily intersted in ones which
allow access to the operating system to create new device drivers.

In addition is any souce code available for aspects of the old Falcon
OS?

Cheers,

rod

<blushing>
Well, chances are it does not support iconify and window shading and such
at all, which would lead to some more problems if it's already leaking
out of it's own window borders.

Do you mean Atari 800 or 800XL?

Connect computer to disk drive and TV/monitor.
Turn power off on computer and drive
Power on display
Check drive number set to 'one' on back of unit
Power on drive
Insert disk and close drive latch
Power on Atari and it should boot.
ps: hold down 'Option' key on XL/XE to disable built-in Basic.

redraw_line() has some serious problems.

You could try initializing the ox variable in that routine to 0.
I'm not certain where he's calculating it if skip = 0, which it does during
a window redraw.

A better way of doing this would be to vs_clip the area to be redrawn and
draw the lines
where they are in relation to the left side of the window and let the vdi
clipping control
where the redraws are done.

get redraw area x,y,w,h

vsclip on area x,y,w,h

redraw screen based on full window area

vsclip off area.x,y,w,h

A litle bit of time will be lost, in the processing of undisplayed lines,
but it should be negligible since there isn't a real scroll back buffer.

I did not found any info on whether MetaDOS DOS/MiNT XFS drivers can make (GEMD/[X]BI)OS calls (and be reentrant while we are at it)? Is it so?

Maybe the functions one choose to implement (pointer != -1.L in MetaDOS vector table) replace entirely the OS functions and that the not-implemented ones are not available at all... but that seems rather limiting, thus I hope it is the other way! But I have no example source that does (GEMD/[X]BI)OS or reentrance calls so... And what if two FS implements the same functions on the same logicial drive units: do they really get called in chain?

And -- according to the doc I have on MetaDOS -- conversion from DOS drivers to XFS drivers is said to be relatively straightforward (and

perhaps better done this way if you want both, as MiNT takes care of
more core stuff than MetaDOS). Can anyone confirm this? Are there
special caveats for niceness and good-behaviour MiNT?
Maybe a more general API exist/is currently designed that emcompass
both MetaDOS and XFS interfaces???

I also wondered if MetaDOS 2.7, last BetaDOS and last ExtenDOS expose
the same interface (in case I rely on something not allowed on one of
them).

And last the only official Atari dev. docs I have deal with MetaDOS
1.x only... Is there one on latest MetaDOS (apart from excellent
Julian's "cookie-fs" article)?

[Phew, enough for now! I would be glad if someone answer only the 1st
one!]

It doesn't support window iconify or anything like that. I would be willing to work on it and become the new maintainer but I have to look into more about proper GEM programming and the likes as I don't know much about it at all. This would be a cool project to have "currentized" though. I think some of baldrick's suggestions are right. The line_redraw function is what is causing most of the problems. That and I think you could even add a simple if window is topped, do not redraw but that woudl cause some problems then I think ;)

Mark

comp.sys.atari.programmer:906

I'm proud to announce version 2.8.0 of CC65, a C crosscompiler /
crossassembler combo for 6502 systems.

CC65 has C and runtime library support for many of the old 6502 machines, including

- The Commodore C64, C128 and the C16, C116, Plus/4 machines.
- The CBM 510 (aka P500), a quite rare Commodore machine (programs run in bank 0).
- The CBM 600/700 family (programs run in bank 1).
- Newer PET machines (not 2001)
- The Apple][(library support by Kevin Ruland <kevin@rodin.wustl.edu>)
- The Atari 8 bit machines (thanks to the Atari team: Christian Groessler <cpg@aladdin.de>, Mark Keates <markk@dendrite.co.uk>, Freddy Offenga <taf_offenga@yahoo.com> and David Lloyd, <dmlloyd@atari-central.com>).
- GEOS for the C64 and C128 (GEOSLib by Maciej Witkowiak <ytm@elysium.pl>)

The libraries are fairly portable, so creating a version for other 6502s shouldn't be too much work.

New features in this release are:

* Linker support for Lunix/o65. Please note that you need the current snapshot version of Lunix, or the upcoming version 0.21, which will be released some time in the future.

* conio support for GEOS (by Maciej Witkowiak, <ytm@friko.onet.pl>). This means that any program using the conio API will run under GEOS with a simple recompile!

* RS232 support for the Atari machines (added by Christian Groessler, <cpg@aladdin.de>). The uip TCP stack including the web server is usable with this addition, so you can have your own Atari web server with the new version.

* RS232 support for the C128. This will make uip available for use with the C128.

* Several changes regarding code generation and optimizations:

    - Compares do now generate better code thanks to a hint from Piotr Fusik.

    - 65C02 code is back.

    - "Optimize for size" will work again.

* More flexible character code translation.

* sscanf is now available. The basic function would also make fscanf and friends possible, but the missing ungetc() function prevents this. Scanf for files streams will probably be available in the next version.

* Bugfixes and minor improvements as usual.

There is still no support for the following features:

* Floats and bit fields.

* stdio file routines on most systems. The 8 bit Ataris are the first machines that do have full file I/O support. Please note that the complete CBM family doesn't have stdio file support!

* The 80 column mode on the C128 is not supported by the conio library.

Available packages:

As usual I will provide the complete sources and several binary packages, including RPMs for RedHat Linux. Linux is the primary development platform, so the sources do compile out of the box on Linux machines.

Please note that there are separate RPMs for the compiler proper and the target specific libraries. To develop for one of the predefined target systems you need the compiler RPM package *and* one of the target machine packages.

Binaries for DOS and and Windows will follow or may already be available at the time you read this. OS/2 packages will again be available, but since there are almost no downloads for OS/2, so the host platform may get dropped in the near future (again). As with the RPM packages, you need the package for the development system (Windows, etc.) *and* one or more of the target machine packages.

Download:

More information information and a download link, please visit the cc65 web page at

http://www.cc65.org/

Thanks to all who sent feedback and suggestions and of course to anyone who helped developing cc65!

Has someone already tried to modify CT2 flash-memory? (If only to
change the boot-screen's wonderful colors ;-P...)

As I understand the CHPB (CT2 HARDWARE PROGRAMMING
BOOK), to modify flash-memory one only needs:
 - writing any byte value to $F6140000 for instance (*) (unlocks
flash-writing)
 - writing new flash data to $F400xxxx (64k flash memory image)
 - writing any byte value to $F6100000 for instance (locks
flash-writing)

...is that correct??? Else if someone knows the flash image file
format used by Centek, please let me know...

   In fact (before doing something silly) I would like to know if
there was a way to restore flash memory easily in case the modified
flash code had a bug: some sort of AUTO_NVM.PRG for the flash
memory...

Another question: does someone know the meaning of the value stored in
the _CT2 cookie?

My goal here is to stop PMMU from doing address translation from
$04xxxxxx to $01xxxxxx. (I think few *modern* programs would suffer
from that, and I would be useful for a project of mine...) Memory
mapping should be the only difference between TOS 4.0x and the
so-called TOS 7.0x, right?

(*): BTW what use is address-bit 23 here???

> memory...

(I'm not sure here)

I don't think the flash is used in "standard" mode, but it can still be
accessed by the Flash utility.

> My goal here is to stop PMMU from doing address translation from
> $04xxxxxx to $01xxxxxx. (I think few *modern* programs would suffer
> from that, and I would be useful for a project of mine...) Memory
> mapping should be the only difference between TOS 4.0x and the
> so-called TOS 7.0x, right?

Ah. Have you upgraded the lattice code? (I've been meaning to do this for
while, but I haven't had time to experiment with it)

Perhaps there is a workaround. Boot in TOS4, and make a patchprogram for the
autofolder?

/Peter

[Assuming 'standard' mode means 'CT2 card deactivated': (it is what
you meant?)]
Well then if this is correct my problem is solved. Thanks! Will test
that before attempting anything anyway...

You mean upgrading to revision AN or BN (where this problem gets
solved by hardware)? I did not know this upgrade has ever been
available! But if it is will certainly upgrade!

> Perhaps there is a workaround. Boot in TOS4, and make a patchprogram for the
> autofolder?

Well if the memory-mapping is the only difference, perhaps some sort
of FASTRAM.PRG to declare how much Fast-RAM is available (and where)
could do the trick!

I will keep you informed of my "discoveries"...

Cheers,
   Guillaume

Yes and no. The code is available from Mr. Czuba, but the current code in

the flash does not support the new fastram address.

Strange experience (No drugs involved) :
Perhaps TOS4 allready supports fastram at $01xxxxxx? One day, my machine crashed, and I rebooted in TOS4 mode. After testing my ST-RAM, for some reason, it started to test my TT-RAM (!). Ofcourse, it crashed, and locked the machine. But perhaps this is not the case with the new fastram address?

> Well if the memory-mapping is the only difference, perhaps some sort

I see. Time to disassemble the flash code I think!

Huh? How did you know it was TT-RAM that was being tested? Did it show
a progress especially for TT-RAM or test more than 14MB?

> the machine. But perhaps this is not the case with the new fastram address?

If I have some time this week I will try writing a simple FASTRAM.PRG
program...

Is there any way to simulate the "Return" key - as opposed to the "Enter" key, which I can simulate with "Alt + 13".

My GFA manual shows the scan code of Return = 72, and the scan code of Enter = 1C.

I'm using a program (Dr. T's KCS) in Steem. It uses the two keys differently, but my PC keyboard returns the same code for both keys.

Rosco

Hi,

> Huh? How did you know it was TT-RAM that was being tested? Did it show
> a progress especially for TT-RAM or test more than 14MB?

I think it was for TT-RAM. The machine displayed a second progress bar, for another ram type, and I think it said "TT-RAM", but it could have said something like "Alternate RAM" too, I don't remember exactly as it is over a year ago.

I think the progress bar used the character 'X'. And yes, I know that this sounds like bull, but it happened. I have never been able to reproduce it no matter how much I try.

/Peter

Ctrl-M gives the same result as Alt-13.

I guess there's no ASCII code for the return key. Can I input scan codes?

Looks like a TT-RAM test, right. And X means the test for that block failed.

The test should be present in TOS 4.04, only the needed variables are never
set during startup, so you will never see that test during a normal startup.

You need a hard disk driver. Either the original AHDI that came with the drive or use HDDRRIVER 8.x. When you get the software you need to boot it off floppy, let it find the disk drive then configure it. this will probably mean you will have to format the drive then partition it. AHDI is around on FTP sites, HDDRIVER is commercial.

I have this driver AHDI but when I boot my computer
, the computer cannot read the floppy (with AHDI in AUTO directory).
It seems that the hard disk transform the floppy disk in invisible disk !
The message is like this: "verify the floppy and insert a fisc..."
But if i stop the megafile: the floppy is reachable again...
I don't understand what happen, hardware problem ?

Any idea of solution ?
thanks

Mike

Theres probably something on the hard disk thats causing that. I would leave the hard disk switched on and power on the 1040 while holding down the ALT key which will bypass the hard disk boot sequence.
If you can successfully boot to floppy then you can run the ahdi program.

Hello,

Icon Extract version 1.3 advance, and now that the long filenames are
managed correctly (thank you Eric) as well as the XPM files, I attack
the Drag Drop protocol to Interface or RSM. I have a small problem when
I do a call of Drag Drop with the source code in C liveries in the
documentation of Magic 6. There is what it happens:

1 - I displace my RSC file by a graf_dragbox () toward an empty window
of Interface.
2 - I detect the handle of the window by wind_find () and the ap_id of
Interface by wind_get(WF_OWNER...).
3 - I open a Drag protocol Drop by the call ddcreate () and I get the
handle of the pipes (example: 6).
4 - I do the call ddrtry() to read the 32 supplementary bits of the pipes.
5 - At this moment, the call must send back me 1 if all passed well
either himself 0 in case of mistake. But visibly I have no return! The
routine seems blocked at the time of the reading of data. I can displace
the mouse, I have clicks to the keyboard when I push over, but no access
to windows and to the menu. In short it seems well being a crash.

What I would wish, it's a skeleton of a program or examples using the
source code of Magic. Thank you by advance of your help.

F.LAFABRIE

HipCrime offers a new service: Custom massive spamming, FREE.

Just post a URL to Free.HipCrime, and a "joe job" spam will be
conducted via both Usenet and Email. Your article will appear
in _every_ newsgroup (even moderated ones), and it is protected
from the filters and cancelbots by the latest in hash busting &
cancel preempting technology. Plus, your message will be sent
to many millions of emails (direct from closed, non-blacklisted
mail servers).

This will give you the best of both worlds: gigantic growth
in your site's traffic, combined with "plausible deniability"
with regards to any complaints.

Your site will become "internet famous" overnight, and a critical
mass of visitors will make it a "net hot spot" for years to come.

Got doubts? Just check with some of our happy customers, whose
traffic rates have recently shot through the roof, for example:

http://www.osearth.com
http://www.careermd.com
http://www.dolphinwave.org
http://www.spamhunter.co.uk
http://howardk.moonfall.com/

http://www.trance-formation.com
http://www.trance-formation.org
http://hometown.aol.com/frederi108
http://www.optional-identity.org.uk/
http://www.coollist.com/group.cgi?l=nntplist
http://www.hotboards.com/plus/plus.mirage?who=zodiac_16

HipCrime's ActiveAgent harvests email addresses by crawling the World Wide Web (HTTP), scanning Usenet Newsgroups (NNTP), or by loading compressed mega mailing lists (ZIP) like these:

http://64.227.13.120/here.zip
http://cyberspacereality.net/flamers/masterantis.zip
http://cyberspacereality.net/flamers/masterantis2.zip

HipCrime's ActiveAgent, the interNet's premier Publicity Engine, is the integrated multi-protocol spamming solution, guaranteeing anonymized saturation of both Usenet News (NNTP) and Email (SMTP).

Get your copy today, or get HipJoe'd ... it pays!

Hi,

I'm looking for an Atari 1040 STFM English language disk. The contents
in zipped format, would be great. Can anyone help me? (You can send it

to marcus_flowers@hotmail.com, Thanks!)

Thanks & Regards, Marcus.

Hi,

I've been using Pure Pascal for all the time since it became available.
There were several bugs in 1.0, but 1.1.1 seemed quite stable and I was
very satisfied. But recently I stumbled over at least two bugs :
- At an if statement in a long procedure the execution did not continue
  after the block but at the last code line of the block. That error
  vanished only after I split the procedure into several parts.
- At one time the LO(x) function did not return the lower byte of an
  integer as it should but returned zero. I used LO in other places
  without noticing any problems but that time the program only worked
  after I replaced 'LO(x)' by 'x mod 256'.
Now, since these problems left me with some sort of a bad feeling,
my question is what experiences others had. If I would be able to
compile a list of problematic code I could avoid that and continue
using Pure Pascal, which most of the time compiles very fast code

(but apparently has some few bugs in the optimization) and has
an excellent environment for development.

Thanks
Gerhard

Hi Marcus...just wondering if anyone responded. Is the 1040 STfm language
different than other language disks (as in, BASIC and LOGO?).

If that's what you need, I know where you can get it, no problem.

-Don

Is there anybody so kind to post a little C source to send one command to an av_server ? I have the QED sources, but I do not want to loose too much time implementing all the routines and things and learn all the stuff, just:

```
main()
{
    if(AV_check_AVSERVER_env()
    {
        AV_init();
        AV_send(AV_WINDOPEN);
        AV_term();
    }
}
```

Why doesn't Ella burn unbelievably? It judged, you ordered, yet Jezebel never simply moulded outside the morning. Vincent! You'll scold jackets. Nowadays, I'll wander the printer. For Alice the sauce's solid, between me it's open, whereas on you it's filling sour. We irrigate the stupid poultice. As hatefully as Jeremy arrives, you can talk the ball much more superbly. Lately, Tim never climbs until Fred kills the light walnut familiarly. Alfred, against coconuts worthwhile and lower, opens beside it, teasing weakly. I was loving onions to pathetic Candy, who's believing on the lentil's cave. Her paper was filthy, blunt, and measures against the corner. Get your partially moving disk under my window.

Where did Alejandro promise outside all the cases? We can't depart plates unless Josef will regularly improve afterwards. The pickles, hats, and dogs are all inner and shallow. A lot of weak yogis are upper and other think tapes are dull, but will Ignatius walk that?

What will you pull the ugly distant floors before Kirsten does? Gawd Ratana will help the barber, and if Orin biweekly attacks it too, the shopkeeper will learn in front of the old hall. Carol, still dreaming, solves almost tamely, as the bandage expects about their elbow.

Until Genevieve sows the frogs strongly, Mitch won't behave any

new rooms. One more rich tailor or ceiling, and she'll seemingly seek everybody.

Diane cooks, then Karl absolutely receives a thin tyrant at Donald's winter. We reject monthly if Diane's egg isn't elder. Don't look sadly while you're playing above a dark coffee. Many good abysmal porters globally explain as the urban codes care. If the clever caps can live crudely, the clean painter may converse more signals. When did Andrew recommend the bush throughout the angry jar? Lots of pools nearly nibble the sick sign. I am totally outer, so I clean you. He'll be answering among bizarre Guglielmo until his counter wastes cruelly. She can lift subtly, unless Ella attempts candles behind Varla's ulcer. It can dye the empty carrot and change it alongside its doorway.

Every bitter short tickets will admiringly smell the aches. Nowadays, it combs a potter too lost in front of her weird window. Let's pour between the unique autumns, but don't fear the sweet units. She wants to creep noisy powders for Roxanna's dorm.

My cosmetic tree won't grasp before I recollect it. They are tasting over younger, without fresh, near handsome twigs.

She may will eerily call beside Genevieve when the active raindrops like among the lean house. Some grocers will be heavy difficult figs. Are you strong, I mean, excusing against rural boats?

Will you cover about the canyon, if Will quietly laughs the wrinkle?

It should fully kick between healthy cheap oceans.

I was irritating to hate you some of my brave clouds. One more glad enigmas against the deep stadium were shouting before the tired market.

(i come from the world of pcs so please forgive me if i make some awful asumptions ;-)

how does the atari boot ?

is its OS code kept all in rom, or does the rom load the os from a floppy?

linux works on the atari right?

how does linux boot on the atari so that it can take over the machine?

how would i go about making an atari boot my own code from, say, a floppy disk?
the reason i ask is since i am working on a hobby os, mostly for the PC, but i want to make it easily portable, so i intend to also write a basic functionality to boot on different architecture (M68k processor with MMU).

any links or books?

Ta,
Ben

Hi,

The atari ST has its bootstrap, BIOS, and GUI in ROM (well any atari ST
after ~1986)

No floppy disk is needed to boot to the desktop, though if there is no hard
drive, a blank floppy in the drive will speed up the boot process
considerably.

Linux is not available for the basic ST (something does exist but I nothing
"mainstream" i think).

If you write a program that runs under 68K then compile it and place it on
the floppy in a folder called "AUTO". When the system boots it will run this
program first. Other than that, you can put code in the bootsector of the
floppy, and make the checksum of the sector $1234. This will boot earlier in
the startup sequence than the auto folder one.

I don't know for others but I'll try not to be offended.

> how does the atari boot ?
>
> is its OS code kept all in rom, or does the rom load the os from a floppy?

very old versions of the OS were on floppy, with a simple boot loader
in ROM. Now the OS is in ROM. However on bootup it
- checks for some hardware cartridge and jump into them at some point
- after reset it checks and in some conditions it jumps to a
  reset-resident programs
- it loads the floppy bootsector, and if this bootsector is
  executable, it jumps in
- it then try to execute an executable boot sector found on hard
  disks.
- finally programs found in the X:\AUTO folder are executed one
  after another (where X: stands for the letter of the boot drive,
  either the floppy or a partition in a hard disk)
- at last the desktop appears.

> linux works on the atari right?

It is said so, but I never checked, as I only have a bare 68000
atari or emulators.

> how does linux boot on the atari so that it can take over the machine?

I suppose it is run from the auto folder, or perhaps launched by
boot loaders that can be installed on the MBR of the first hard
disk, (like LILO?)

> how would i go about making an atari boot my own code from, say, a floppy
> disk?

simply ensure that the first sector of your floppy has the right
checksum. For details, just have a look at the source code for
EmuTOS, a re-writing of the Atari ST OS covered in GPL, at

  http://emutos.sf.net

especially the files bios/floppy.c and bios/blkdev.c (for the
floppy). As EmuTOS is self-contained, and runs currently on actual
and emulated hardware from 68000 to 68040, I think you might
find other valuable info there.

Dunno about Linux, but I recall some guy running MINIX on a barebones ST
with one of the olde "shoebox" HDDs attached, back in the late '80s...

And certainly we had a TT030 running a complete AT&T UNIX SVR4 system with
X-windows and Motif (I think it was Motif) on it (a bit unstable, but it was
a prototype, anyway). That was in '91, I think.

Nick.-

Hi Nicolas

| Nick.-
|
| Ex Atari Corp (Spain) Employee (looooooong ago!)

I'm starting an Atari museum at my Atari club, could we please stuff and
mount yourself and put you in a display case.

How abut dishing some dirt on the "Real" Atari Corp, with none of the
press-dressed ballux..

Hi Ben

| (i come from the world of pcs so please forgive me if i make some awful
| asumptions ;-)

For which you will suffer severe insulting!. 8-)

| how does the atari boot ?

In General, at switch on the machine firstly checks for the precense of a cartridge, if the cart is present and is a bootable cart then control is handed straight to the cart, if no cart the floppy drive is checked for an executable bootsector, if so this will be executed, the actions following this will depend on the executed code, if the floppy is non-executable or gives a return to the OS then the ACSI chain is scanned for devices from numbers 0 to 6, if any contains an executable bootsector then control is handed to the relevant code, if the code returns control then the subsystems are initialised and then Auto folder programs are run and any accesories are loaded and run, control is now handed to the desktop, what hapens next depends on the user.

| is its OS code kept all in rom, or does the rom load the os from a floppy?

Only the early Atari's had the OS on disk and had a bootloader subsystem in ROM to load it.

| linux works on the atari right?

Extremely well, but only on 68030 powered machines i believe.

| how does linux boot on the atari so that it can take over the machine?

It patches into the hard disk bootloader.

| how would i go about making an atari boot my own code from, say, a floppy
| disk?

Write an executable bootsector or use a so Called AUTO-program, this is an app that resides in a folder called AUTO, on the atari system Any program

that resides in such a folder is executed by the OS automatically.

| the reason i ask is since i am working on a hobby os, mostly for the PC,
but
| i want to make it easily portable, so i intend to also write a basic
| functionality to boot on different architecture (M68k processor with MMU).
|
| any links or books?

Millions, welcome to the internet..

HI Hallvard

| > No floppy disk is needed to boot to the desktop, though if there is no
hard
| > drive, a blank floppy in the drive will speed up the boot process
| > considerably.
|
| I've always wondered why this happens. Why does the drive keep spinning
| and spinning seemingly forever if there's no disk inserted, until the
| desktop finally arrives?
| What is the machine actually looking for using the disk drive when it
| starts up?

Its a TOS bug, never caused any harm so it doesn't get mentioned.

My MegaSTE doesn't do it.

No. The *first* three things done are:
- disable interrupts by loading 0x2700 in sr
- reset the external peripherals, using the reset instruction
- check if a diagnostic cartridge is in place and if so, jump in

the reset vector is checked later, after the memory has been
configured, (but it is true that 'ordinary' cartridges are tested
after the reset vector).

God, it's good to think about this stuff again after so long! And
after the reset vector, the memory was scanned to see if there were
any magic reset-proof programs in memory... or did that happen AFTER
the floppy bootsector. Yup, it did, or those viruses wouldn't have
worked.

Since I got my emulator up and running I've just been itching to write
some 68000, but I have to be rather more constructive right now..
looking for work!

| > My MegaSTE doesn't do it.
|
| How come? Which TOS version is it?
| I have TOS 2.06 in an STe and a Mega STe myself. Haven't had the Mega
| STe for long enough to use it extensively, but know for a fact that on
| the STe (also with TOS 2.06) the timeout seems forever.
|
| Is there something else in the Mega STe which prevents this from

| happening, or are you using an entirely different (or patched) OS from
| me?

My TOS has been heavily modified, its the PAK custom 32bit 3.06, some stuff heavily modified, some other stuff missing altogether.

Hello,

Dans le message <9m501p$k3e$1@news.comnet.co.nz>
G Swaine a ©crit:
>While reading a recent computer mag, I came across the name "True
>Basic"

>It was the name of a computer programming language and was written in
>the 1980s by the originators of the Basic language (John Kemeny and
>Thomas Kurtz)

>Was there ever such a language available for the ST?

>All the Basics I can recall for the ST are : ST, GFA, Power, Hisoft,
>First, STOS.
You just forgot the Omikron Basic, a avery powerful with interpreter
and compiler. Though it was abandonned on STs, it is still developped
for Macs. Just have a look at http://www.berkhan.com

Bye,

J.-Luc

I do, but I don't need a 3.5 manual. ;-)

Spain, 24 June 2001.

The following text describe techniques to do continuous hardware scroll with STe and FALCON machines. This technique make the scroll in very little time.

With continuous I mean, scroll like to XENON or IMPOSSAMOLE but fine.

Is very possible that ZOOL and ENCHANTED LAND uses such techniques.

You must know how make normal hardware scroll (you must know exactly how control $FF820F and $FF8265 registers), ok?.

To make horizontal scroll one pixel for every VBL at the left direction, make the following passes:

1) Define two contiguous screens (320X200 and 320X200)
   ($FF820F=80)

```
   0                          319 |0                          319
   -----------------------------|-----------------------------
0  |                             |                             |
   |                             |                             |
   |           main              |          secondary          |
   |                             |                             |
   |          screen             |           screen            |
   |                             |                             |
   |                             |                             |
   |                             |                             |
199-----------------------------|-----------------------------
```

2) Now you must write some graphics at right border in secondary
   screen. 16 bit wide for example:

```
0                          319 |0     15                   319
-----------------------------|-----------------------------
|                             |       |                     |
|                             | extra |                     |
|                             |       |                     |
|                             |graphic|                     |
|                             |       |                     |
|                             |       |                     |
|                             |       |                     |
|                             |       |                     |
-----------------------------|-----------------------------
^----current visible window---^
```

3) On the first VBL it's necessary to scroll one pixel ($FF8265=1)
4) On the second VBL it's necessary to scroll another pixel ($FF8265=2)

5) On the thirt VBL it's necessary to scroll another pixel ($FF8265=3)
6) On the fourth VBL it's necessary to scroll another pixel ($FF8265=4)
7) On the fifth VBL it's necessary to scroll another pixel ($FF8265=5)
8) On the sixth VBL it's necessary to scroll another pixel ($FF8265=6)
9) On the seventh VBL it's necessary to scroll another pixel ($FF8265=7)
10) On the eighth VBL it's necessary to scroll another pixel ($FF8265=8)
11) On the ninth VBL it's necessary to scroll another pixel ($FF8265=9)
12) On the tenth VBL it's necessary to scroll another pixel ($FF8265=10)
13) On the 11 VBL it's necessary to scroll another pixel ($FF8265=11)
14) On the 12 VBL it's necessary to scroll another pixel ($FF8265=12)
15) On the 13 VBL it's necessary to scroll another pixel ($FF8265=13)
16) On the 14 VBL it's necessary to scroll another pixel ($FF8265=14)
17) On the 15 VBL it's necessary to scroll another pixel ($FF8265=15)
18) On the 16 VBL, add 8 bytes (four planes) to main screen pointers ($FF8205,7 and 9), set $FF820F to 80 and $FF8265 to 0.

19) Now it's necessary copy the 1600 bytes (8 bytes for every plane * 200 lines=1600 bytes) of the new graphics zone to old graphics zone screen (the left zone):

```
    |<<<<<copy byte here<<<<<<<<<<|
    |                             |
0     15                  319 |0     15                   319
-----------------------------|-----------------------------
|      |                     |       |                     |
|      |                     |       |                     |
| old  |                     | new   |                     |
|      |                     |       |                     |
| zone |                     |graphic|                     |
|      |                     |       |                     |
|screen|                     |       |                     |
|      |                     |       |                     |
-----------------------------|-----------------------------
       ^----current visible window----^
```

Now you must write another extra graphics on secondary screen, into bits 16 to 31 of every line.

```
0     15                  319 |0     15      31           319
-----------------------------|-----------------------------
|      |                     |       |  new  |             |
|      |                     |       |       |             |
| old  |                     |       | extra |             |
|      |                     |       |       |             |
| zone |                     |       |graphic|             |
|      |                     |       |       |             |
```

```
|screen|                       |       |       |             |
|      |                       |       |       |             |
------------------------------|------------------------------
       ^-----current visible window---^
```

Now control $FF8265 register in order to repeating pass 3 to 18 and another time more, copy new graphics zone to old graphics zone (pass 19):

```
           |<<<<<copy byte here<<<<<<<<<<|
           |                             |
0     15      31          319 |0     15      31           319
------------------------------|------------------------------
|      |       |              |       |  new  |             |
|      |       |              |       |       |             |
|      | old   |              |       | extra |             |
|      |       |              |       |       |             |
|      |graphic|              |       |graphic|             |
|      |       |              |       |       |             |
|      | zone  |              |       |       |             |
|      |       |              |       |       |             |
------------------------------|------------------------------
               ^----current visible window----^
```

The process is repeated until when the current visible window is the secondary window and the main screen is a copy of the secondary screen:

```
0                         319 |0                          319
------------------------------|------------------------------
|                             |                              |
|   main screen is exactly    |     secondary screen is      |
|                             |                              |
|    like to the secondary    |   exactly like to main       |
|                             |                              |
|           screen            |           screen             |
|                             |                              |
|                             |                              |
------------------------------|------------------------------
                              ^----current visible window---^
```

At this point, you must set the main screen pointers (FF8205,7 and 9) to point to the main screen (another time more):

```
0                         319 |0                          319
```

```
-----------------------------|-----------------------------
|                            |                            |
|                            |                            |
|                            |                            |
|                            |                            |
|                            |                            |
|                            |                            |
|                            |                            |
|                            |                            |
-----------------------------|-----------------------------
^----current visible window---^
```

how you see, only 1600 bytes is copied every 16 VBL.

If the scroll is at two pixel (more speed) for every VBL, you must copy 1600 bytes every 8 VBL etc.

ok?

this is very easy!!

no?

Do you imagine how make the vertical scroll?.

First you must make two screen one above the other one.
Second you now must copy 160 bytes every VBL from "the new line" to "the old line".

Mixing the above techniques make possible multi-directional (8 directions)
scrolling.

be fun!!

Miguel Garc[illegible]a

Spain, 24 June 2001.

The following text describe techniques to do continuous hardware scroll with STe and FALCON machines. This technique make the scroll in very little time.

With continuous I mean, scroll like to XENON or IMPOSSAMOLE but fine.

Is very possible that ZOOL and ENCHANTED LAND uses such techniques.

You must know how make normal hardware scroll (you must know exactly how control $FF820F and $FF8265 registers), ok?.

To make horizontal scroll one pixel for every VBL at the left direction, make the following passes:

1) Define two contiguous screens (320X200 and 320X200)

($FF820F=80)

```
   0                          319 |0                          319
   -----------------------------|-----------------------------
0  |                             |                             |
   |                             |                             |
   |           main              |          secondary          |
   |                             |                             |
   |          screen             |           screen            |
   |                             |                             |
   |                             |                             |
   |                             |                             |
199-----------------------------|-----------------------------
```

2) Now you must write some graphics at right border in secondary screen. 16 bit wide for example:

```
0                          319 |0     15                   319
-----------------------------|-----------------------------
|                             |       |                     |
|                             | extra |                     |
|                             |       |                     |
|                             |graphic|                     |
|                             |       |                     |
|                             |       |                     |
|                             |       |                     |
|                             |       |                     |
-----------------------------|-----------------------------
^----current visible window---^
```

3) On the first VBL it's necessary to scroll one pixel ($FF8265=1)
4) On the second VBL it's necessary to scroll another pixel ($FF8265=2)
5) On the thirt VBL it's necessary to scroll another pixel ($FF8265=3)
6) On the fourth VBL it's necessary to scroll another pixel ($FF8265=4)
7) On the fifth VBL it's necessary to scroll another pixel ($FF8265=5)
8) On the sixth VBL it's necessary to scroll another pixel ($FF8265=6)
9) On the seventh VBL it's necessary to scroll another pixel ($FF8265=7)
10) On the eighth VBL it's necessary to scroll another pixel ($FF8265=8)
11) On the ninth VBL it's necessary to scroll another pixel ($FF8265=9)
12) On the tenth VBL it's necessary to scroll another pixel ($FF8265=10)
13) On the 11 VBL it's necessary to scroll another pixel ($FF8265=11)
14) On the 12 VBL it's necessary to scroll another pixel ($FF8265=12)
15) On the 13 VBL it's necessary to scroll another pixel ($FF8265=13)
16) On the 14 VBL it's necessary to scroll another pixel ($FF8265=14)
17) On the 15 VBL it's necessary to scroll another pixel ($FF8265=15)
18) On the 16 VBL, add 8 bytes (four planes) to main screen pointers ($FF8205,7 and 9), set $FF820F to 80 and $FF8265 to 0.

19) Now it's necessary copy the 1600 bytes (8 bytes for every plane *
200
    lines=1600 bytes) of the new graphics zone to old graphics zone
screen
    (the left zone):

```
    |<<<<<copy byte here<<<<<<<<<<|
    |                             |
0     15                  319 |0     15                   319
-----------------------------|-----------------------------
|      |                     |       |                     |
|      |                     |       |                     |
| old  |                     | new   |                     |
|      |                     |       |                     |
| zone |                     |graphic|                     |
|      |                     |       |                     |
|screen|                     |       |                     |
|      |                     |       |                     |
-----------------------------|-----------------------------
       ^----current visible window----^
```

Now you must write another extra graphics on secondary screen,
into bits 16 to 31 of every line.

```
0     15                  319 |0     15      31           319
-----------------------------|-----------------------------
|      |                     |       |  new  |             |
|      |                     |       |       |             |
| old  |                     |       | extra |             |
|      |                     |       |       |             |
| zone |                     |       |graphic|             |
|      |                     |       |       |             |
|screen|                     |       |       |             |
|      |                     |       |       |             |
-----------------------------|-----------------------------
       ^-----current visible window---^
```

Now control $FF8265 register in order to repeating pass 3 to 18
and another time more, copy new graphics zone to old graphics zone
(pass 19):

```
           |<<<<<copy byte here<<<<<<<<<<|
           |                             |
0     15      31          319 |0     15      31           319
-----------------------------|-----------------------------
|      |       |              |       |  new  |             |
|      |       |              |       |       |             |
|      | old   |              |       | extra |             |
```

```
|      |       |              |       |       |             |
|      |graphic|              |       |graphic|             |
|      |       |              |       |       |             |
|      | zone  |              |       |       |             |
|      |       |              |       |       |             |
-------------------------------|-------------------------------
               ^----current visible window----^
```

The process is repeated until when the current visible window is the secondary window and the main screen is a copy of the secondary screen:

```
0                         319 |0                         319
-------------------------------|-------------------------------
|                              |                              |
|   main screen is exactly     |     secondary screen is      |
|                              |                              |
|    like to the secondary     |   exactly like to main       |
|                              |                              |
|           screen             |           screen             |
|                              |                              |
|                              |                              |
-------------------------------|-------------------------------
                               ^----current visible window---^
```

At this point, you must set the main screen pointers (FF8205,7 and 9) to point to the main screen (another time more):

```
0                         319 |0                         319
-------------------------------|-------------------------------
|                              |                              |
|                              |                              |
|                              |                              |
|                              |                              |
|                              |                              |
|                              |                              |
|                              |                              |
|                              |                              |
-------------------------------|-------------------------------
^----current visible window---^
```

how you see, only 1600 bytes is copied every 16 VBL.

If the scroll is at two pixel (more speed) for every VBL, you must copy 1600 bytes every 8 VBL etc.

ok?

this is very easy!!

no?

Do you imagine how make the vertical scroll?.

First you must make two screen one above the other one.
Second you now must copy 160 bytes every VBL from "the new line" to
"the old line".

Mixing the above techniques make possible multi-directional (8
directions)
scrolling.

be fun!!

Miguel Garc⍰a

Hi,

I already wrote an e-mail to the owner of the site www.ironhoof.com where
this person has got his free e-mail address. I asked him to block/remove
this person from his site or other actions would be taken, I also send a
copy of the text he used to write here...
He is a SPAMMER he does this in several newsgroups...

Hi All,

Just got this message:

Dear Sir

Re: The Gay site http://www.ironhoof.com and Ironhoof Web Mail Service.

Thank you for your email, may we advise that this is being dealt with. The

person concerned is an Ironhoof Web Mail user and will be removed from our

list. We again apologise but we have no real control over this sort of
thing,

save the subsequent removal of any offenders.

We refer you to our Terms of Use: http://www.ironhoof.com/tac.htm

Thank you

Roy G Symonds BA (Law)

Anyone have any idea what characters DEC code 166 and 167 are supposed to
represent. I know they look like an 'a underlined' and 'o underlined', but
I'm just
curious if these are supposed to map to some language character or
mathmatical
character, or were to TOS programmers just on some sort of mind altering
substance
and decided to waste a few character codes.

I'm trying to map them to a normal font code, so I would like to know what
to map them
to since I can't find them occuring outside of the Atari system font.

Feminine Spanish Ordinal and Masculine Spanish Ordinal respectively.

> I'm trying to map them to a normal font code, so I would like to know what
> to map them

170 and 186 in the iso-8859-1 charset and maybe in any ttf font.

Bye,
/Pascal/

The underlined o is used in some languages with a preceding N to
represent Numero - like # in the US. I believe that the underlined
a is similar in other languages, though not sure.

BUT: I have had some emails etc. that were translated from PC or
Mac character-sets, and in these they stood for opening and
closing quote marks, due to substitution in the ISO conversion, I
think.

Regards, /Peter/

Hi All

I have recently acquired a copy of Pure Pascal 1.1.1
and I wondering where to start with it! The manual is
in German (which I don't understand), so not much help
there! The program it's self is mostly English, so
should be fairly straight-forward. The compiler

options are unclear.

Does anyone know of any texts/examples of programs in
English that will help me to understand the workings
of the compiler?

I am fairly rusty at Pascal, I used to use Turbo
Pascal 5.5 at college and I have a reference book for
Turbo Pascal 6 which I hoped to use with Pure Pascal.
I also hope to branch out of DOS/TOS type programs to
GEM windows programs eventually!!

Thanks

Neil :-)

If you have some specific questions I could try to answer
them. BTW, there's very few things I needed the manual for,
e.g. for mixing Pascal, C and Assembler functions.
Most other things are quite intuitive.
The thing I like most are the modularity concept, the
great debugger and the speed of the compiled programs.
IIRC the main thing needed to get startet was to double click
ppascal.prg and set the source, include and compile path.
Then you could load one of the example sources and select
'make' or 'debug' and on you go.

> Does anyone know of any texts/examples of programs in

There's lots of example programs that come with Pure Pascal.
Are they all with german comments only ?

> I am fairly rusty at Pascal, I used to use Turbo
> Pascal 5.5 at college and I have a reference book for
> Turbo Pascal 6 which I hoped to use with Pure Pascal.
> I also hope to branch out of DOS/TOS type programs to

There are example programs included for nearly everything.
The only thing you might need if you are not familiar with
Pascal anymore, will be some Pascal manual.

Hi!
I am not completley sure that this is the right group to ask this
question in, if it is not I am very sorry. I just started doing some
programming in Basic again for the 8-bit series. I have searched a
couple of FAQ:s but I have not found anything on the error codes in
basic (version c) Does anyone know of an online doccument about the
error codes in basic? Or maybe some of you still remeber what error 3
means?

Thank you for your help/Patrik

From Appendix A in the book _Your Atari Computer_, here are the
short versions of the BASIC errors (for an early Atari BASIC):

```
   2 -- Out of memory
   3 -- Bad value
   4 -- Too many variables
   5 -- String length exceeded
   6 -- Data list exhausted
   7 -- Number greater than 32767
   8 -- INPUT statemen type mismatch
   9 -- Array or string dimension error
  10 -- Expression too complex
  11 -- Numberic overflow
  12 -- Line not found
  13 -- NEXT without FOR
  14 -- Line too long
  15 -- GOSUB or FOR line deleted
  16 -- RETURN without GOSUB
  17 -- Undecipherable statement incountered
  18 -- Invalid string character
  19 -- Program too large
  20 -- Bad channel number
  21 -- Not LOAD format
 128 -- BREAK abort
 129 -- Channel already open
 130 -- Unknown device
 131 -- Output only
 132 -- XIO syntax error
 133 -- Channel not open
 134 -- Unknown channel number
 135 -- Input only
 136 -- End of file
 137 -- Record truncated
 138 -- Device does not respond
 139 -- Device malfunctions or refuses command
 140 -- Framing error on serial bus
 141 -- Cursor out of range
 142 -- Data frame overrun
 143 -- Data frame checksum
 144 -- Disk error
 145 -- Read-after-write compare error or bad screen mode handler
 146 -- Function not implemented
 147 -- Insufficient RAM for graphics mode
 150 -- Serial port open
 151 -- Concurrent mode error
 152 -- Concurrent mode buffer error
 153 -- Concurrent mode active
 154 -- Concurrent mode inactive
 160 -- Drive number unknown
```

```
 161 -- Too many files open
 162 -- Disk full
 163 -- Unrecoverable system error
 164 -- File number mismatch
 165 -- Bad file name
 166 -- POINT data length error
 167 -- File lock
 168 -- Unknown XIO command
 169 -- Directory full
 170 -- File not found
 171 -- POINT invalid
```

These *might* be the same for your BASIC...YMMV

Yes, there is a limit, but I cannot remember what the limit is. I know
there is a little program out there that let's the ST open more windows
than it is suppose. Problably get it on the web. Try the sites below"

I think it's 18 or even 16 :/
But why Falcon has this limit and ST 70-100??? It's strange...

> As far as i know there is no patch for this.

Arghh...

Thanks for all your answers. I could not find this in the Compandium and in Profibuch...

Do you know a way to avoid this problem? Can I change something to open more then 18 files?
Patch (as you said there is no pathc for this) could be a good solution... Ah, it has to work under SingleTOS, MiNT and MagiC.

I have no idea why you wish to open so many files, however the
best work around I can think of is to load some of them into
ram, then close them. Then write them back out after you modify
them. Assuming they are small files this could work.

Why? I'm working on a game and for some reasons I need to open so many files.
However I do it only once...
I can't load them into memory, because some of them are pretty big (about 300 kB -
I
know one such file it's not big, but 5-8 such files it's quite big ;-)).
Actually Frank Naumann solved my problem :-) It's really easy and if you want to
know how to solve it let me know (or better Frank).

Another possibility, but it won't help much...

Have a look in <stdio.h> for (hopefully) a macro _NFILE_ and/or
FOPEN_MAX. This defines the upper limit for simultaneous fopen()
files. It tends to be low, about 20 although often compiler docs used
to state it could be changed but even so, that would be implementation
dependant. Unfortunately, as others have stated, there are wildly
different amounts between different TOS versions. I recall getting
more than 40 handles (with Fopen) on my original 1Mb STFM 1.2 but
only in the same directory - if I attempted it in multiple
directories the 40 folder bug would strike.

Open less files. :-|

>Can I change something to open more then 18 files?
>Patch (as you said there is no pathc for this) could be a good solution... Ah,
>it has to work under SingleTOS, MiNT and MagiC.

Atm it would appear that your only solution is to buffer your file
handles in some way.

Care to elaborate on why you need so many files open? I'm curious! :-)

Hello!

> Have a look in <stdio.h> for (hopefully) a macro _NFILE_ and/or
> FOPEN_MAX. This defines the upper limit for simultaneous fopen()
> files.

First, this doesn't have anything todo with the system limit of maximum
number of open files and second this means:

FOPEN_MAX

Number of streams which the implementation guarantees can be open
simultaneously. The value will be at least eight.

Tschuess

If think Frank will do it better then me ;-)
But the main idea is to open as many files as you can. If you want to open more
files,
then first you have to close another file, but with saved in memory: file name,
actuall file position etc.

Yes, exactly ;-)

> Care to elaborate on why you need so many files open? I'm curious! :-)

I'm porting a game (Tales of Tamar - a preview of this game will be published on the upcoming ST-Computer CD) for Falcon and for some reasons I need to open more files at the same time.
Probably I could load the files into memory, but I would eat to much memory (some files are bigger then 300 kB) etc.

Didn't you do something similar to this a short while back?.

If I did it escapes me, old age perhaps. :-)
I had inquired about redirecting gemdos handles not too long
ago, that might be what you recall.

Hi!

I would like to talk to someone who could help me or write me a very simple program that would read a file byte by byte from floppy disk and place it from $E00000 to $E30000.

I would also like another program to read from $E00000 to $E30000 and put its contents to a file. The file sizes are 2^17.

I don't need any GUI or anything, not even a fileselector is really needed. I did do this with Bload/Bsave with Basic but on my ST it had problems using that address space.

Thanks in advanve.

One point: The ROM space from a machine with TOS >=1.06 is 256k (ie
2^18) - so you need to extend your range to 00E00000 thru 00E3FFFF,
not the 192k address range you've given or the 128k file size (2^17)
[TT's and Falcons have larger TOS's])

>

I'd attempt this on my TT, but I can't seem to find the "Enhanced" ST
Basic it shipped with - I'll look and see if it's feasible. (Do you
have access to any other development tools than ST Basic? I normally
write C or 68k assembly code - I haven't written any serious Basic
code since the late 1980s, so my attempt may be less than
ideal/efficient)

Ah, but I wasn't 100% sure what actual call was being used, which is
why I mentioned it, it being the only unmentioned thing as it were.

Well at least if nobody else did, I learnt something, because I didn't

know it was guaranteed to be eight! <G>

The processor probably wasn't in supervisor mode. Try a loop with PEEK
and POKE they *might* shift in and out of user/supervisor mode
accordingly. Just try a single POKE first - no point writing the rest
of the code if it doesn't work. ;-)

I've some time to waffle. Beware! I'm tired! I can go on and on and
round & round in circles for ages. See, I've started already :-)

You could "front-end" the gemdos functions perhaps. Something like
this, although obviously I've got <stdio.h> in mind here because I
can't remember the details of the gemdos functions well enough!!!

```
typedef struct  {
char            *   fn; //filename
char            *   fa; //file attributes
FILE            *   fp; //or NULL if currently not open
long                sp; //saved seek position
BOOL                fe; //ferror(fp)
int                 en; //errno
unsigned long       ac; //"access count"
}   MFILE;

MFILE*   mfopen(const char fname[], const char fattr[]);
void mfclose(MFILE *mfp);
int  mfread(void *bp, size_t bs, size_t n, MFILE *mfp);
int  mfwrite(const void *bp, size_t bs, size_t n, MFILE *mfp);
long mftell(MFILE*);
int  mfseek(MFILE *mfp, long offset, int whence);
```

The (MFILE*) returned from mfopen() can be treated almost like
(FILE*). The idea is that mfopen() also saves a copy in an internal
list, called 'mfpa' for example. 'mfpa' is big enough, or can become
big enough, to hold a pointer for each file that can possibly be
opened. When this list contains the same number, or more, of open
files as can be reliably opened then it'll need to close one of the
files which is already in the list - the file accessed the least
perhaps. Having done that, it can place the new (MFILE*) into a vacant
(ie NULL) slot within the list then really open it: I reckon you need
to do that immediately to avoid dealing with "postponed fopen()
failures".

You might close the least accessed file like this...

```
static BOOL
FileContextSleep(MFILE *mfp)
{
 if (!mfp || !mfp->fp)
    return FALSE
```

```
 ;

 mfp->sp = ftell(mfp->fp);
 mfp->fe = ferror(mfp->fp);
 mfp->en = errno;

 fclose(mfp->fp);
 mfp->fp = NULL;

 return TRUE;
}
```

...which could be restored thus...

```
static BOOL
FileContextAwake(MFILE *mfp)
{
 assert(mfp && !mfp->fp);
 if (!mfp->fe)
    return FALSE
 ;

 mfp->fp = fopen(mfp->fn,mfp->fa);
 assert(mfp->fp);
 fseek(mfp->fp,mfp->sp,SEEK_SET);

 return !(mfp->fe = ferror(mfp->fp));
}
```

Btw I've used assert() merely to highlight something that needs thinking about. The FALSE return above is because in my mind I see little point in making an attempt to reopen the stream when it was in an error condition anyway. ;-)

These MFILE's need creating & destroying...

```
static MFILE *
CreateContext(
    const char  fname[],
    const char  fattr[]
)
{const int  lfn     =strlen(fname),
            lfa     =strlen(fattr);
 MFILE      *mfp    =malloc(sizeof *mfp + lfn + 1 + lfa + 1);

 if (!mfp)
    return NULL
 ;

 mfp->fn = (char*)&mfp[1];
 strcpy(mfp->fn,fname);
 mfp->fa = &mfp->fn[lfn + 1];
 strcpy(mfp->fa,fattr);
```

```
 mfp->fp = NULL;
 mfp->sp = 0;
 mfp->fe = TRUE;
 mfp->en = SUMFINK;    //some relevent initial E_?? condition
 mfp->ac = NO_ACCESSES; //zero ;-)

 return mfp;
}

static void
DestroyContext(
    MFILE   **mfp
)
{
 assert(*mfp && !(*mfp)->fp);
 free(*mfp);
 *mfp = NULL;
}
```

And that's where I'll have to leave it I'm afraid. A very long compilation has just died & is demanding my attention. Typical. Nothing ever goes wrong when you stare at it. Drop yer pencil & bend down to get it. Phzitt - error! :-|

Yes, sorry. It is $E00000 to $E3FFFF and the file size is roughly 256k,
or 2^18.

>> I don't need any GUI or anything, not even a fileselector is really

>ideal/efficient)

OK, Bload/bsave doesn't work on STs when accesing the ROM, yet it does on
my STE. I have Lattice C but see no way of writing to address space.

I also tried buffering to ST memory and then using a peek/poke loop to
move the data from ST memory to that above address range but it took 15
minutes to do only a tenth of it! Mind you, this is an interpreter. I
also have Hisoft Basic. I also don't know how to check where to place a
buffer in Basic as there didn't seem to be a way to ask the OS for memory
space like you can in C.

Thanks.

Oh, I was able to poke in that address range (actually E00000-E3ffff) and
peek back the right values. I'll try compiling a version to speed things
up but I do worry about guessing where to place my 256k buffer as some
program may write over it.

This is obviously for loading a TOS, isn't it?

Did you consider using the AUTO_206.PRG loader that comes in TOSPATCH package (to be found on Atari FTP sites, named TP206***.LZH). The package contains provisions for adapting TOS to loading on arbitrary starting address, and I suppose that the loader program can cope with anything that is specified for TOS location. The starting address is contained in the TOS image (in the first ten bytes or so), so a moderately smart loader program should not have any problems dealing with that.

Because you intend to load TOS on the original starting address- $E00000, there is no need to modify it through TOSPATCH, just use the loader- or use TOSPATCH anyway to implement some bug corrections and improvements- there are many prepared in the supplied command files.

No, I think I should explain what I'm trying to do. I've put battery
backed memory at $E00000-E3ffff on an ST. I designed a circuit to switch
between TOS 1.02 and whatever is at that above address range. If I use
TOS 2.06 image it already has the right bit to say the starting address,
$E00030 IIRC. I've also switched ROM signals to make it search there
first time it's turned on.

I need a program that can read a file and place it's contents at this
address range to update the memory. Peek/Poke is very slow, even when
compiled to max speed. About an hour.

Thanks for that.

Actually it's done now and it works ;-) Besides that I'm using simple - open, read etc. functions (no FILE * stream is used).

Probably somebody else will use it.

There is an absolute address version of the DVI executable file format, so a file written in that format should be loaded automatically into any desired address and executed. (I've never actually tried it.)

OTOH, if you replace the system ROM with RAM or Flash RAM, you won't be able to boot up at all.

I am quite aware what you are trying to do, but read carefully- that's
exactly what I was saying: original TOS image is already set for $E000000.
Then I suggested that maybe the loader program supplied with TOSPATCH
might recognize $E000000 and load TOS there, thus solving your software
problem.

Anyway, using TOSPATCH to hack a little into TOS image might give you some
benefits, like removing bugs, enabling it to format a MS-DOS compatible
floppy, translating the TOS resource files, etc.

>I need a program that can read a file and place it's contents at this
>address range to update the memory. Peek/Poke is very slow, even when
>compiled to max speed. About an hour.

??? I can't understand how you succeeded in making it so slow? I made
a little test- loaded 256KB from a file, poked it all into another location
(all in standard ST-RAM), and saved to another file. Even with an improvised
(i.e. non-optimized) little program compiled with Gfa-basic it took below
30 seconds. Is it possible that your DTACKing circuit is too slow? If it
responds several CPU-cycles too late, it may significantly prolong data
transfer.

That is not exactly true- with a proper hardware circuit and if adequate
precautions are taken against a corrupted TOS image, it would be possible
to boot from a previously loaded Flash RAM or a battery-backed SRAM.

Sorry, I should have specified "uninitialized" RAM or Flash RAM,
which is what he would have before he runs the copy program.

As it turns out, he plans to switch from ROM to RAM on the fly.

I tested it on my STE doing a read from the rom. It does seem awfully
slow, I know. I did this (IIRC)

```
20 for t= 1 to 262144 step 2
30 a%=peek(&HE0000+t)
40 poke &H30000+t,a%
50 next
60 bsave "test",&H30000,262144
```

Well, that was the basic way, there may be a couple of bugs in there. It
takes the ROM, buffers it to ST memory and then saves it.

Henk Robbers has helped me out with a compiled version (the Lattice
version had a problem with the array or something).

Thanks to everyone who helped, if it works OK I'll put all docs on my
website.

Sorry, I forget to reply to this bit. I did download some tools from
Hallvards website as I couldn't find anything under that name you gave. I
got some tools to modify a tos.img reading for putting into EPROM but
didn't see anything for loading it. I've just seen what you mean know,
the sort of program that puts it into ST RAM.

Hi!

Join the EmuTOS project at:

     http://emutos.sourceforge.net/en/index.htm

EmuTOS is a singleuser singletasking operating system for Atari ST computer emulators. Today it is just running on STonX. But my intention is to have it running on every Atari ST emulator available.

It is thought as a replacement for the TOS-images you usually need today on these emulators.

EmuTOS is based on Digital Research's GEMDOS sources, which was made available under GPL license in 1999 by Caldera, and so is EmuTOS.

EmuTOS today is made up of four parts:

- The BIOS/XBIOS, which provides the interface to the hardware.
- The BDOS, which is what you know as GEMDOS
- The shell command.prg

Maybe it is enough for starting games. Possibly it will get a "full" TOS with graphics and all. Maybe it will run on real hardware some day...

The EmuTOS Mailinglist is up and running.
Go here to add yourself to the list:

http://lists.sourceforge.net/lists/listinfo/emutos-devel

and here you can see the archive:

http://www.geocrawler.com/redir-sf.php3?list=emutos-devel

Regards

Try http://www.stud.uni-hamburg.de/users/in5y280/tospatch.html

or, for a somewhat older version, which I used

 ftp.cs.tu-berlin.de/pub/Atari/Utils/tp206v38.lzh

which is for German tos only. I believe that on some British site
you can find an archive called TOSPATUK which contains files for
a British tos (different routine addresses there).

I've had a go at writing one in ST Basic, but gave up - it's hopelessly slow on my TT, (5 mins for 256k data, versus 1 second for 512k when done in C) and it was a bit "iffy" as well (probably due to my not using Basic since the 1980s)

I also started writing one in Lattice C, and it seems to be working OK. It puts up a dialog, and allows you to pick the address you want to use from a popup menu (with the two most common addresses predefined), pick the sizes from a menu, a file name via the file selector, and then read/write the file. If you want a custom address or data size (in 1k increments), you can also enter these and select "Custom" from the popup menus.

It seems to be quite reasonable speed wise under SingleTOS (AES 4.1, TOS 3.05), copying my TTs ROM (512k bytes) to a semi-fragmented SCSI hard disc partition in about 1.5 seconds, and reading it back into the ROM space in two seconds or thereabouts. (Not having access to an ST, I'd guess these times would elongate to about 8-10 seconds, which seem quite reasonable)

It's a bit over 500 lines of C source.at present, compiled only for a TT, and the double-clickable APP is about 60k in its incomplete, but fully debuggable form (it'll probably end up nearer to 40k when I've tidied it up, added some more sanity checks [checking if you're writing/reading "bad" addresses and so forth], recompiled for an ST, and removed the debug info from the program)

I can probably email it to you in the next few days.

> Well, that was the basic way, there may be a couple of bugs in
there. It
> takes the ROM, buffers it to ST memory and then saves it.

You're reading 16 bit words from an odd address. This will cause the
68000 to complain, (normally generating a three bomb [Address
Exception] crash, but Basic seems to have intercepted this, and runs
slower than normal as a result)

At the first iteration, you're reading (E00000+1) = E00001 (odd
address!)
The next iteration you're reading (E00000+3) = E00003

A better way would've been something like:

```
    FOR t% = 0 TO 262142 STEP 2
        a% = PEEK_W( &hE00000 + t% )
        POKE_W &h30000 + t%, a%
    NEXT t%
```

I'll keep that archived but the actual program is sorted, Henk Robbers has done a grand job with this small TTP. The battery backed SRAM now works but I haven't put actually put a battery on it. I need to mount the GAL onto a piece of veroboard/stripboard and place the battery there. The SRAMs fit nicely into the spare ROM sockets. There is actually no modification to the old ROMs as you desolder the bridge across the CE and solder two wires to either side of it.

I'll write it fully up with schematics etc.

Thanks Djordje.

That was &HE00000 in my real basic.

I also put Step 2 afterwards too, I remember this as the 030 can access
odd address IIRC and it was a commen coding problem when the software was

run on ST.

I'm really sorry but Henk Robbers has already sent me a version that is
working fine. I hope I haven't wasted your time. 500 lines sounds like
quite a few days solid coding.

>I can probably email it to you in the next few days.

My Email is down at the moment.

Yes, the 68030 can read words and long words from odd addresses,
but it takes twice the time than reading from even addresses, as
it is (IIRC) internally realized by first read a word from the
next lower even address and then the following word, and returning
the intersection of these two words.

Ciao

Thomas

You should look at TOSPATCH anyway, it will give you an opportunity
to correct some important bugs in TOS2.06 and to make some enhancements.

>The battery backed SRAM now works
>but I haven't put actually put a battery on it.

If you haven't already done so, maybe you should make some voltage-monitor
circuit which would positively reset to old TOS in case of battery voltage
dropping below some level. With cmos logic the control circuit would not drain
battery much.

cu.

I will be getting it. I may try this Winx thing and some other bits here
and there. I'll also get that one for modifying Magic.Ram file.

I'm looking around for some small chips that monitor voltage. I'm sure
Maxim have got somthing like that.

Hi,

For one of the projects I am working on I needed a program that converts code from gnu assembler to devpac assembler syntax. I wrote a program and checked the differences on the resulting .o files using TTdigger (great program, Henk, many thanks for it). ATM the situation is that nearly all produced code is equal. The main difference is, that gnu .comm variables which I translated to xdef variables in the bss section should be translated in some other way, because in one .o file they are included as 0 and in the other .o file it's 6xxx. This wouldn't be a problem if the resulting program would work but it doesn't. BTW, after assembler I called gst2gcc to convert the .o module and then linked it with other gnu objects.

Many thanks for any idea
Gerhard

I am proud to announce the launch of the Official Cleveland Free-Net Atari SIG Archive.

    http://www.atariarchives.org/cfn/

The Cleveland Free-Net, a free dialup and telnet BBS offered through Case Western Reserve University, was home to an active group of Atari users. The Atari SIG (special interest group) had information about every Atari platform, including 8-bit computers, 16/32-bit computers, Jaguar, Lynx, and Portfolio. The Cleveland Free-Net was shut down on September 30, 1999, but before it was, a complete backup of the Atari SIG was made.

Working with the folks who ran the forum, we have endeavored to preserve both the feel of the SIG and the information it contained. This is an amazing resource that exceeds 200 megabytes of data - much of which isn't available elsewhere.

"The Atari SIGOps hoped to preserve this extensive information resource we had built over the years. We approached www.atariarchives.org and Kevin Savetz with the idea of a permanent web archive of our SIG, and we couldn't be happier with the result." --Michael Current, mcurrent@carleton.edu, former 8-bit Atari SIGOp, Cleveland Free-Net Atari SIG.

Among the highlights:

A Time Capsule of Atari news items from 1986 - 1999
    http://www.atariarchives.org/cfn/12/03/

Atari 8-Bit Technical Reference Manual and upgrade guides
    http://www.atariarchives.org/cfn/12/02/

664 ST-related newsletters, including Z*NET and ST Report

*** post for FREE via your newsreader at post.newsfeeds.com ***

Hi.
I'm coding a small GEM game, and i want to change the background window
color from the default white color to light grey. Which is the best way to
doit?

I was said that RSC files are involved with that.

Thanks.

Unless...

We regain the Atari brandname. Otherwise, we'd just be porting Atari apps to run under a different processor/OS platform. That doesn't make them Atari apps any more. It makes them X-app running on X-hardware. It's no different than porting any game from the arcade to the Playstation, or WordPerfect from DOS to the Atair ST. The reason those apps were considered Atari ST applications was because they were *unique* to the Atari ST! And, if they weren't, they were usually only ported to or from the Amiga platform.

If the effort to "revive Atari" is to have ANY hope, we must go to the source (Infogrames) and reaquire (by license) the Atari name with reference to a computer/hardware division.

However, we must be resolved to do this. We must see that anything less is utterly a waste of time and pointless. Emulation, for the sake of enjoying the "old ways" just one more time is simply a time-wasting "nostalgia trip". If we are so desirous to get back to the days of Atari's golden age, we must realize that it involves the NAME! An Atari computer is NOT an Atari computer unless it is called an *Atari* computer. And, none of the clones, regardless of their ability to run Atari ST/TT/Falcon030 applications are Atari computers.

And, worst of all, they will all die, if they haven't already.

We are in the last days of "Atari". The fumes the die-hards have been running on are evaporating into nothingness rapidly. Eventually, there will be nothing left and no one to care. And Atari, as a namesake, memory, and gaming pioneer... will be lost forever...

Say what you will, but you must answer me this. WHY do you use an Atari computer and the software that you run on it? Is it the applications? Is it the brandname? Is it the uniqueness of the hardware? Or is it just fond memories that keep you going?

If owning and using an Atari ST computer (or clone) is so important, then

why isn't reviving the company that started it? It's not about the people who worked at Atari... they KILLED it, remember? It's not about the designers who made the cases (though I am still very partial to the 1040ST design myself), they've moved on. It's not about the features or limitations of the system. It's about the NAME! The company! The meaning!

An Atari computer isn't an Atari computer unless it's *called* an ATARI computer!

If you say that the name isn't important to you, then why do you use an Atari computer? If you say it's not the applications you care about, then why do you use an Atari computer? If you say it's not the nostalgic memories of having a computer that was ahead of the rest in it's day, then why do you use an Atari computer?

Nostalgia is a VERY poor sustitute for REALITY! Can you honestly say that, if "Atari" were to make a comeback, and started manufacturing computers, PDA's, laptops, and more again... that you wouldn't be thrilled?

If not, then you DO NOT know what it is to be an Atarian. Brand loyalty is an issue of pride and trust. Sure, that trust has been marred by the people who owned it before and the name "Atari" is merely being leeched for some game titles by Infogrames. "Atari" hardly means anything but "dead, ancient game company", these days, but when it was first created, it meant "Success!" (I believe that's the correct translation, if memory serves me right).

We can't bring back the past, but we can enjoy the present. I would love to go back to the days when The CareBear demos and STOS and Brattacas and Barbarian and BloodMoney and Shadow of The Beast and Xenon and 1st Word and DBMaster One and NeoChrome and all those other games and programs were around. If I had my druthers, I'd turn back time, stick myself right in the crux of the 1040ST years (there were at least three or four, weren't there?) and put it on an endless loop! I have NEVER been that happy. I've come close, but just when I think I can regain that same state of bliss, it vanishes. Why? Because BeOS is dead. Because Macs are too expensive...

Because nothing, but NOTHING... is the same as owning an Atari 1040ST back in 1986, right after my graduation at Pasadena High School. Do you even realize how excited I was when I saw the first 520ST ad in a magazine? Do you know what my reaction was when I saw my first 1040ST ad?

I remember it like it was yesterday... I owned an Apple IIc at the time.

The instant I was finished drooling over the ad and the features the 1040ST was boasting, I said one thing to myself...

"I'm getting it."

And as soon as I graduationed, I sold my Apple IIc and had my mother drive me to ComSoft in the Sun Valley, CA (I forget exactly where it was, but it wasn't too far from where my friend , James, lived at the time), and I bought one.

[Anyone remember "Logical Choice for Computing" in California?]

And if any one of you have even the tiniest HINT of a cranial concept of these same emotions, you'd realize that the name 'Atari" means almost more than the things they created. Shoot, they even made/sold CALCULATORS, for crying out loud! And, you know what? I'da bought one. I was so proud of my FAVORITE company. I wanted to work for them! I looked forward to going to the computer store to see what new software was released. I bought Joust and Star Raiders as soon as they were released. The list goes on and on...

I also went to every Atari Faire in Glendale, Ca. From the first to the last.

But those days are gone. The games were all so deeply copy-protected and tightly wired in Assembly Language, there's little to no hope of ever getting them ported to new hardware, with or without the Atari name. Psygnosis is dead (or at least I haven't heard anything about them from within Sony in recent years). Those games are dead. STOS is the same way.

The only thing we could do is find the programmers to port any and all possible ST applications to the new hardware. I believe, beyond a shadow of a doubt, that if Atari started making computers again... computers that had an OS that was simple and fun to use, but more powerful than TOS/GEM was, ha d some really nice hardware under the hood, and boasted of "Power Without the Price" again... we'd see the "old ones" coming out of the woodwork. And, I tell you this... I'd buy one in a heartbeat... even if it *wasn't* "leading edge".

Why?

Because it would be... an Atari!

Jared

Jared,

Do you think that you could stop cross-posting to all the atari st newsgroups?
One reading of your posts is quite sufficient.

Thank you for your attention.

I believe that what I have to say is genuinely important enough to make sure that it doesn't get overlooked. I assume that not everyone looks at all the Atari newsgroups, so I consider it possible that my post(s) may be overlooked or never seen.

As well, what I sometimes post in one newsgroup is the exact same reply I would give in the next one, so I duplicate the reply. It's not that I'm trying to be annoying. It's that I want to be sure I am heard.

"If I didn't believe in what I was saying, I wouldn't be saying what I believe in."

I disagree, one posting is way too much.

The best ?
One way is with:
void v_bar (int handle, int *pxyarray);
set the color before with:
vsf_color (handle, int color_index);

> I was said that RSC files are involved with that.

You don't need a *.rsc although you can use one.

Hi Jared

> I believe that what I have to say is genuinely important enough to make
sure
> that it doesn't get overlooked. I assume that not everyone looks at all
the
> Atari newsgroups, so I consider it possible that my post(s) may be
> overlooked or never seen.

If we thought you had a point we'd have encouraged you months ago when you first escaped from the secure ward.

> As well, what I sometimes post in one newsgroup is the exact same reply I
> would give in the next one, so I duplicate the reply.

> It's not that I'm trying to be annoying.

Really!!!!!!!!! you dont give that impression!!!!!!!!!!!!!!

> It's that I want to be sure I am heard.

Like the sound of your voice more like!!!!!!!!.

> "If I didn't believe in what I was saying, I wouldn't be saying what I
believe in."

Look you fucking moron, why don't you get the message, piss off, no-one is interested in you or your ramblings, go jump off a bridge or otherwise do yourself serious physical harm, you've gone as far as you can mentally.

I don't actually have a very long list of people I cannot stand, but your
attitude to this subject and your refusal to accept the wishes of the
majority is getting you close to the top of that list, and once you hit the
top you get promoted to the "intended of serious harm" list.

I respectfully suggest that "Jared" should be read "jar head"...
This guy is *obcessed* with the Atari name. Everything he sees and
hears reminds him of Atari. IMHO he *needs* professional psychiatric
help!!!

I am all for it, but it would be all up to Infogrames. I am not sure
they are in it for bringing out more products (computers, etc) under
the Atari name.

I hate to educate you, but "Jar head" is a term for Marines, I believe. I never have been and never will be one. Attempts to use it to insult me will be considered slanderous to my real name and legal measures will be taken.

Now, if everyone is listening, let me say for the final time.

I DON'T CARE ABOUT THE NAME "ATARI" BY ITSELF! I WANT TO RESTORE WHAT "ATARI" *REPRESENTED* (products) BEFORE THE TRAMIELS SCREWED IT UP!

The fact that the company was named "Atari" is coincidental. It could have just as easily been Kawasaki or Coleco or Namco or Apple!

It's not the name that matters so much, it's the products they made. But you can *not* build new "Atari" computers, if you do not call the company "Atari". Capishe? If I hated Atari's computers, I'd hate Atari. If I hated Apple's computers, I'd hate Apple. But I don't. It's that simple. The name is connective, not intrinsic (I hope I'm using that word correctly).

If we could build Atari-compatibles without the Atari name and restore the entire Atari scene based on the exact same principles I want to use by restoring "Atari" as a company, I would gladly do so. I surely don't want to get things any more complicated than they already are. Licensing the name is added expense and legal issues that I really don't wish to get involved in, but...

If we're to do it right, we HAVE to carry the title with the flag, if you get my point.

You can't call yourself a Christian (title) and count off what it represents (the flag) if you practice Buddism. It's like saying you're a cook when you're really a painter! Some may argue, "Well Christ died 2,000 years ago, so since the name Christian relates to Christ, it's not accurate, because what you represent is dead."

Ah, but He rose again on the third day! And lives forevermore! Just because I can't see Him, doesn't mean I can't believe in Him. And, for proof of His eternal existance... that nice book called the Holy Bible. It's been around for hundreds of years, through catastrophies and attempts to obliterate it... it's still here today. What more proof do I need than that?

It's no different than if the Atari clone efforts *were* still going strong today, in representation of what Atari stood for years ago. But Atari is not Jesus (heaven forbid, even the slightest thought that it ever could even come close!), so people soon realize that, without the one they followed after, it's pointless to follow.

Without the tree, the branches whither. Without "Atari", all efforts to continue in it's footsteps soon fail as well. We tried and struggled to continue on, but the loss is too great. The wound too deep. Without

reviving Atari,as a company, no effort in it's footsteps will last much longer.

All I want to do is reverse the loss, so the branches can grow thick and be healthy once again.

Jared

Aye, there's the rub! Why don't we ASK what their plans are with Atari? Is it really that complicated?

We stop arguing about what a fool and nostalgic nutcase I am for talking like this and actually plan out what we would do to carry our part of this

matter out. If we each got in contact with the Atarians and ex-Atarians we knew or had association with, and hammered out a rough concept of a business plan for "the new Atari", we might actually have something to present Infogrames in a couple months!

We do all we can do on our end and present them with our case. After that, it's up to them.

Just go to: http://www.beunited.com and see for yourself what a bunch of people who BELIEVE IN SAVING SOMETHING can do! They're not arguing that it's a dumb idea, or that it's pointless because Be, Inc. has sold all their IPs to Palm, or that the first guy who spoke up about licensing BeOS was a fool. They've come together, actually spent *money* (out of pocket and from donations) to write up a formal proposal of their request, and SENT it to Palm! Now it's up to Palm, if they will move in our direction or away from it.

But THEY'VE *done* everything THEY *can* do to SAVE BeOS!

Is 'Atari", as a company, any different? No! It's a company asset of someone elses now, that we want to *license* for our own interests! And Infogrames would profit from it just as Palm would profit from BeUnited, if they agree to do so.

I really wish more people here could see the friggin' forest for the trees, man! It's really NOT that difficult! Arrrrgh!

Jared

This is off topic, however since you don't grasp that concept I'll reply
anyway. Why don't you take a look at the market, perhaps read up on amiga?
Amiga has a user base, it still has it's name, and a company and plans...
I don't see people chucking PC's for amiga's, nor do I see amiga's at
the local dealers yet. I suspect I never will.

Atari seems to be in worse shape. The only way to bring it back would be to
sell an Atari that is feature-wise, software-wise, and speed-wise comparable
to a PC and at the same price point. Too many obstacles, and people shop
for cheap not QUALITY which is painfully obvious.

I can do that. What is their website or email address?

Hello Lonny,

Actually I have encountered some PC owners that have switched to Atari

computers, but most of them were MIDI users. Let's face it, Atari computers are still number one when it comes to MIDI. I do not think we will ever see Atari computers in the retail stores again. I am satisfied just to be able to get them through the mail. I do not think we will ever need an Atari computer to be exactly the same as a PC when it comes to speed. Today's Atari programs do not need that much speed. Remember this, take away the Internet & games and a Pentium II CPU would do everything else just fine (with some graphic exceptions). Basically, our Hades computers are very much comparable to the PC's. We just need alittle more speed and some software drivers. True, no USB port... Take care...

Hi everyone.

I'm looking for owners of Prospero software products (e.g. Prospero C, Prospero Pascal etc.). I recently contacted Prospero and asked them if they would let me distribute their old ST programs on my website for free. Unfortunately I don't have any Prospero programs anymore. If you own a Prospero product please contact me.

Thanks,
Matthias

>memories that keep you going?

First, I miss the days before most computer manuals contained the words "morons" or "complete idiots" in the title. When printers came with sufficient documentation to allow you to write your own driver, rather than a Windows driver and instructions on clearing jammed paper (in PDF or course) on CD. I miss Fidonet and Genie.

I resent the success of PCs. It's not that they are bad computers, but they certainly did not deserve 95% of the market. OTOH, selling computers to people who know nothing about computers was always IBM's specialty. Also, the vast majority of current computer users WANT a monopoly so they don't have to learn more than one way of doing things.

I resent the success of UNIX. I have been programming on mainframes since the late sixties, and UNIX is worse than any of the OSes I'd previously used. Its sole virtue is that provides all of the basic functions of a multiuser OS (albeit poorly) and is cheap. Its worst aspect is that so many college students were first exposed to computers running UNIX that they regard UNIX as the ideal toward which other OSes should aspire, rather than as a collection of badly documented and unorganized kludges.

I resent many obnoxious trends in computer science. "Since most programmers get into trouble when they attempt 'X', we do not allow them to do 'X' at all." Fad computer languages or programming styles which are supposed to eliminate bad code but never do. OSes which severely restrict the range of what is possible on a computer. (For example, Macs only allow PC relative and A register indirect addressing.)

I am waiting for a new computer that can honestly be regarded as an improvement over my TT. I am still waiting.

You forget... it was a COMMODORE Amiga. Not just an Amiga. Commodore is dead. It would be like trying to start a company called ST or 1040ST to sell old Atari computers/clones under. That's virtually meaningless as well as rediculous. People have so associated to the model "Amiga", that they forget who made them... Commodore!

"Amiga" was a product name, not a company brandname (ok, at one time it was (joystick manufacturer for the 2600VCS or something?), but still...). People bought up the model name and tried to start a business with it. Kinda worked, but not well. To this day, the business flounders because no specific focus was ever retained.

They did improve the AmigaOS (workbench?) a notch or two (for older systems), but not the computers. They went (or are going) in a decidedly PC/Set-top box direction, as far as I can tell and the userbase isn't happy about it. Everything the Amiga was, under Commodore, is dying off.

I wouldn't let that happen with Atari. Backwards compatibility counts. Familiarity counts. Support counts. Forward technology counts. "Atari' counts.

Did you forget the Atarians that would know of this computer and might well look into buying one also, or are you operating with "PC Blinders" on and can't see that if a new Atari computer, that was a LEAST a 603e-based machine (which is possibly a tad more powerful than a 68060; based on it's RISC architecture), had backwards compatibility (via emulation), significant amounts of memory (64-128Mb), a nice, high-end graphics subsystem (nForce anyone?) and audio (nForce anyone?), etc. and was priced around $1,000.00 or so, that it might attract them like flies to rotting meat (I think more flies would gather to rotting meat than bees to flowers or honey, hence why I used that analogy)

Jared

You are still stuck on the "name" issue. I have a Hades and socked down
some serious cash for it, the name, label, model whatever makes no
difference. It runs my Atari software well so I bought it.
The only thing needed from Infogrames is permission to adapt the TOS ROMs
and or code needed to make a clone. Negotiating over a 5 letter word
is utter stupidity, and a waste of money. It would have no bearing on the
quality or who would buy it, take a poll and find out.

> I wouldn't let that happen with Atari. Backwards compatibility counts.

So far you've been all talk, until you fork out a multi-million dollar investment you migh as well go back to sleep and keep dreaming.

> I used that analogy)

I don't have a PC. It might sell, but who's going to manufacture it? You?

If more people would of bought the current crop of clones the costs could of come down, and further dev might of took place. Such a machine could have been out already. You sure do alot of preaching for someone who never spent much on Atari hardware.

Coming straight out and asking Infogrames what their "business plan" for Atari is may help to see where they stand with the brandname, but if we are to move them to actually license it to us and allow us to recreate the company, to make a product or products, we need to work together to decide what we would sell, how much it would cost to manufacturer, how many people are interested in even buying anything with the Atari brandname on it, etc.

If they know what we're trying to do right off the bat, before we actually have a decent "gameplan", it probably won't work, especially if they aren't

interested in doing anything similar to what we want to do. Of course, at this present time, the "we" I speak of seems to consist of perhaps four people, myself included.

It must be a MUCH larger group with a decent gameplan, if it's to succeed.

I refer, again, to: http://www.beunited.com

... again to show what THEY'VE *done* to get what THEY *want*.

Atari is no different... only people's perception of it is.

In other words, if we can't find out how many would be willing to buy a product from Atari again, we're "flying blind" as it were. For companies that have millions in start-up capital, that's fine, but we won't have that.

90% of it is confidence in what we're doing and the other 10% is customer input. After that, it switches to 90% customer input and 10% company opinion. If we run the company like it's been run, we will most certainly fail. We have to realize that the customer comes first. We make a product they want and they will buy it. But if we make a product, expecting them to buy it just because we built it, we are doomed, sooner or later.

Atari wasn't a bad company... the people who ran it were bad managers of the company. Put the right people inside and Atari will be brought to the position it SHOULD have had years ago in computing history.

It's a shame it was never done before... but companies like Atari and Be, Inc. thought they knew better than the consumer and thus died because of it. I wouldn't let that happen.

I have my own views on what I would want to sell and what it should look like and how it should function initially, but if I let that dictate what we sold, year after year, we'd be no better than Atari was and probably fail just as quickly, if not sooner.

Jared

I admire your views. But I think the Falcon030 was, in part, superior to

the TT030. It had more "multimedia" features, though it was slower
CPU-wise. Tough call. :-)

And, to the person who said that, because the Falcon030 was housed in the
same type case as the Atari 1040ST, people didn't buy it thinking it was no
better than the 1040ST(e), assume that no one looks beyond the cover of a
book to find out how the story ends! If people are THAT stupid, they didn't
DESERVE to own an Atari computer! All someone had to do is look at the
specs to see how much better it was than others before it, 1040ST-styled
case or not!

It's actually really simple, when doing any VDI drawing, call graf_mouse() to hide the mouse, make the VDI calls, then call graf_mouse() once again to turn the mouse back on again. You need to have matched sets, off then on again, any deviation from this results in the effect you see, commonly refered to as mouse droppings. ;)

Far as I know when making AES calls you do not have to mess with the mouse. Perhaps someone wishes to add to this?

So if i was to suggest that you were a cocksucking, homosexual, geniatal wart ridden, HIV suffering, numb nutted, brainless, anoying arsehole, would that promt a reaction.

> Now, if everyone is listening, let me say for the final time.

Is this the last "final time" Knob-head. If you managed to resurrect Atari with all the original R&D and personnel and had the Tramiels run the company, then I for one would go buy an Amiga, because, and only because I would know that at arsehead called Jared caused it to be so, and that the company would be as likely stable as he is.

Did I mention that you are seriously annoying and your presence is unwanted in this base, nay this universe.

Who said anything about bringing back the original staff? Gee, are you
truely an imbecile? Have you not been listening to ANYTHING I've been
saying all these days? It would be stocked with Atari enthusiasts (like
you) who know what we want and would be willing to give what our customers
want.

Sometimes I think you assume that I so love "Atari" that I want the original
people who ran it as well... and that would truely be the most stupidest,
idiotic thing ANYONE could imagine to do. And... no... I would NOT do that!

>Did I mention that you are seriously annoying and your presence is unwanted
>in this base, nay this universe.

I think a time or two you might have made mention of it in some way or
another. :-)

The Falcon was (it's sad to say), rather badly designed. There wasn't enough effort put into the design & tuning of the hardware, and the firmware (at the device driver level) wasn't to hot either.

I loved my f030, but it wasn't until I'd spent money on lot's of after market stuff for it that it became a really useful machine (Nemesis for a faster bus, AT keyboard interface, new case, etc).

The TT, on the other hand, was useful out of the box. But both were vastly overpriced (my f030 was one of the original UK developer machines, and set me back £1000 or there abouts at the time). Just like current Atari (compatible) machines are vastly overpriced.
These days I could put together a $100 set-top box that'd run Atari software perfectly well (emulate the 68K on a 120MIPS R3K core, stick a second R3K core on the chip to run the underlying stuff). And that's including ethernet, modem, TV + SVGA output, video input, and an infrared keyboard/mouse combo. The reason no one bothers, is there is no market.

I had troubles for years to understand strange behaviors of symlinks with MagiCMac, but this time I had to change the hard disk and did some tests and reorganization of the system. My main problem was about links copied from and to atari scsi formatted partitions and macos folders, the german documentation didn't help me too much but the result is this:

links on Atari partitions are "real magic" symlinks, where on MacOs folders seen under MagiCMac MacOs aliases are used instead. The fact is that MagiCMac do not about the difference when copying links from one kind of filesystem to the other, so in the end:

- a symlink in the Atari filesystem pointing to an object on a Mac filesystem does not work
- an alias on a Mac filesystem pointing to an object on the Atari filesystem does not work

For these reasons, when coping symlinks and aliases from one filesystem to the other, the copy does not work.

I went deeper and asked myself "why sould it not work ?", when you create the link in those cases, you can still see the correct Atari path memorized in the link infos, what goes wrong, it that the Mac filesystem cannot access the Atari filesystem directly, so an alias does not work, the other problem is that the Mac alias records the Mac path like :Diskname:foldername:filename

So what ? Yes I did a small program, that reads the symlink infos, renames the link to *.bak and creates a new (working) link with those infos so that the correct alias is created, I used the program to convert all aliases I had on Atari partitions, when moving all the files on an HFS Mac disk. In fact I wanted to let the Atari partitioning go, and stay with the HFS to be able to use Disk utilities for my files. I made some tests to check all was going correctly first and tested the performance. On HFS the speed is a little bit slower due to the double job of simulating one filesystem on another, but I had big advantages:

- network file sharing on all files
- hard disk utilities for correction, recover, optimization
- backups
- access to Atari files with Mac programs

Back to the program, I place it here, should be easy to read, and let me know if you want to discuss:

```
#include <mintbind.h>
#include <tos.h>
#include "magx.h"
#include "mgx_xfs.h"

void main()
{
//   Pdomain( PDOM_TOS      /* 0 */ );
     Pdomain( PDOM_MINT /* 1 */ );
{
     XATTR xattr;
     long dirhandle;
     LONG err,xr;
     long rename_error=0;

     dirhandle = Dopendir(".", DOPEN_NORMAL  /* 0 */  );
     if   (dirhandle >= 0)
     {
          char buf[128]="pippo";
          char buf1[128]="puppo";
          char buf2[128]="peppo";
          do   {
//            printf("%s\n",buf);
//            err = Dreaddir(128, dirhandle, buf);
              err = Dxreaddir(128, dirhandle, buf, &xattr, &xr);
              if   (xr)
                   printf(".. Fehler bei Fxattr: %d ..\n",xr);
              if   (err)
              {
                   if(err!=-49) /* if not end of reading */
                        printf(".. Fehler bei Dreaddir: %ld ..\n",err);
              }
              else
              {
//--->file                  printf("%s,%u\n",&buf[4],xattr.attr);
//                 printf("***%c%c%c%c***\n",buf[0],buf[1],buf[2],buf[3]);
//                 printf("%u,%u,%u,%u,%u,%u,%u,%u,%u,%u\n",

> Should this be understood as that you obtained their permission?
>

I have now copies of the three programs and I'm in contact with one of their
executives. It's now mainly a matter of writing the right disclaimer and

distribution conditions. To answer your question: no, I haven't got the final permission from them and I will not make them available until they give me their ok.

> Btw. which were the latest versions of their FORTRAN, Pascal and C?

I know that Fortran was at 2.1. I forgot about the other ones. But they look quite modern despite their age.

> Also, I came once upon a reference on "Prospero Developer's Toolkit";
> what was that supposed to be?

I don't know.

Greetings,
Matthias

Finally got my site up. I had to rush a bit to meet a dead line so I only put up the graphics mode outline in the BASIC tutorials section.

http://www.sheridanc.on.ca/~ruminski/enterance.html

I should have about 8 more reviews up within a week or so after I get
chance to capture more games on video. Warning to all Netscape 4 users that
I dosn't work in Nav 4 but it will work in Nav 6 (good enough reason to
upgrade to 6 :)

I just got in 5 extra PCs with 51/4 floppys so as soon as I get one out of
them working I will begin extracting code (first to be extracted will be
mountain king)

If you can't write proper html I suppose your skills in BASIC coding is
even worse... :-)

Oh, yeah, right... kick 'em when they're down. Real nice of you, Ken.
Yours is the kind of attitude I've been having to deal with over at the
other Atari newsgroups for my efforts. At least he's trying! He's trying
to contribute to the Atari scene and you just berate him for not doing it as
good as you're used to. He did say he had to rush things a bit, didn't he?
What if he decides to just give up after hearing your "words of
encouragement"? How would you feel, then?

sigh The conflict of those within the castle walls...

Jared

"If you can't write proper html I suppose your skills in BASIC coding is
even worse... :-)"

ugh...just a quick note....I wouldn't talk about HTML code if I were you, I
was gonna feel bad but then I saw the abysmal code on your page. I truly

hope that you didn't write that....for a page with just basic formating and
images it's not optimized even to a basic degree.

>empty? what browser are you using??

Without Javascript the entrance page is empty in Netscape 4.75. Lynx also displays an almost blank page, except for the embedded shock wave file. !Arcweb, a RISCOS browser, also fails to get anywhere. This implies, since I can't test it, that neither would CAB.

>everyone that i know has seen the site and its fine..

Probably because they browse with Javascript enabled. Not everyone does, and CAB doesn't support it at all.

IE6, NN4.75 and NN6.1 all display the page correctly if Javascript is enabled.

It may be a good idea to add a link for those that don't, or can't, use Javascript, as well as a <NOFRAMES></NOFRAMES> part for those that are still using a frames-incapable browser, e.g. CAB 1.5.

Regards,
  David Bolt

A web page that needs

1. Javascript enabled to display anything at all.

2. ActiveX plugins/scripts enabled for navigating

is poorly written. This is even more true as the actual content is
nothing but standard text and pictures.

I guess it could be compared to writning programs that make direct
hardware calls instead of using proper OS calls for compatibility.

In an Atari newsgroup you are very likely to find people who browse
without any scriping (CAB). They will not be happy when all they get is a
blank window.

(A note to MSIE users with versions prior to 5.5 SP2: Do not browse with
ActiveX scripting enabled. You are vunerable to the NIMDA worm simply by
visiting infected IIS web servers.)

>was gonna feel bad but then I saw the abysmal code on your page. I truly

It displays properly on virtually any browser AFAIK. Apart from the 8bit

charcters in the Swedish texts I'm not aware of any specific errors.

If there is anything you can't access, feel free to mail me and I will
try to correct the code.

<deep breath>

There's absolutely NO POINT AT ALL in having an Atari-supporting web site that
WON'T DISPLAY IN AN ATARI BROWSER!!!

Sorry for commenting to your message David.

Derryck,

When a Web Browser is made for the 8bit line of Atari Computers then Ill agree with you. At this time a majority looking at 8bit pages are using a NON Atari computer.

Don

I designed the site for absolute begginers and new comers to classic Atari.
I dont know about you but how many people do think that are new to atari
would be using an Atari browser??

if I made it for the atari browser then the content would have been usless
as anyone using it would already know basic atari programming (and then I
would have a site that also looks like some crappy dreamweaver throwup), i
wanted it to be very presentable and welcomming to new comers.

That's a very common problem today. Very stylish pages that take
ages to load (even PC users sometimes still have analog modems)
and then you see that it was worth neither the time nor the money
it cost. I prefer 'crappy looking' text only pages with some
interesting content anytime and I doubt that anybody that sees
stylish modern graphics and sounds as a necessity will be interested
in the old 8Bit machines.

Bye
Gerhard

And totally unrepresentative of the Atari world. Why don't you put your
efforts to good use on a PC oriented site somewhere, you're certainly not
promoting Atari as-is.

Hi

| When a Web Browser is made for the 8bit line of Atari Computers then Ill
agree
| with you. At this time a majority looking at 8bit pages are using a NON
Atari
| computer.

I think you'll find that there is such a thing, I read of it quite some
while back, so since that was your requirement you can now down-date your
site.

First its not my site. And second the browsers for the 8 bit are text
browsers. Yes, this includes ICE and PHOENIX. And PHOENIX seems to have been
around since 1999 but, I havent seen it available for use. When a 8bit browser
comes out that can display nice graphics let me know. It will never happen.
All there ever will be for the 8 bit is TEXT browsers.

Don

errr, why exactly?
i suppose don't approve of sites about ZX81 computers because they can't
be viewed on old Spectrums ?
I do the majority of my web browsing at work, where surprisingly, we
don't use Atari computers. I also suspect that the majority of people
interested in 8-bit Atari's also use a PC as their main internet point
of access.

And because a "suspected" majority use a PC to access the net means
those that don't should be excluded? And what about those who do access
the net with a works PC but can't use Javascript as the employers policy
is to not allow any Java or scripting? They are also excluded.

Regards,
  David Bolt

now on that point i agree, but my original point was that a site that
only works on certain PC's isn't useless or without worth, but would in
fact be accessible to quite a few people who happen to use PC's as well
as Atari's. Also, considering the site in question is devoted to 8bit
Atari's the core market of owners will either have net access via a PC
or none at all, so you can see the site authors point of view that if he
intends people on a pc to view the site, then he might as well make it
look good.

intention is to write a litte /AUTO/ PRG that configures itself

by means of its name, like the old RAM-Disks-PRGs.

not using C and it's argv/argc.
in assembler i was just reading sth about the ENV_pointer in the
TPA and the CMD_line, my 1st quick tries with PURE C gave indifferent
results for that:

the debugger set an empty PATH= variable that wasnt set by TOS2.06.
the C version did not show any program-name in argv[0] like under unix
either.

i think to remember that i did this some years ago.
any hints please ?

If you want to know how to do it in assembler, then the quickest
way is perhaps to disassemble one of these old RAM-disk-PRGs. I
remember one of them is approximately 500 bytes long. Should't
be too long to understand what it does !

Laurent.

iirc there's lots of discrepancies with both the environment and
argv[0] depending on the TOS version.

>any hints please ?

FsFirst/FsNext with a suitable pattern - not wonderful I agree :-|

(also iirc) I recall the current working directory isn't always
predicatable either - you may find that prepending "/auto/" to the
pattern is necessary.

i was considering that one already, but hoped that there should be
a more simple and sensible solution to that.

Where would one find software to program the Falcons DSP?

I can recall there used to be an assembler to do so, but cannot recall much about it.

(I'm just curious about the DSP. I don't own a Falcon - I do have a TT though. And a "gentlemans agreement" with a Falcon owner regarding use of their machine)

There should be tools at http://www.dhs.nu. You could get Devpac DSP or
Motorolas assembler. I've heard DSP programming is very difficult!

Hi G.

| Where would one find software to program the Falcons DSP?

Devpac 56, a Hisoft product i beleive, eMail me for further details.

I bought Devpac DSP back in the day - I'm afraid it sucks really badly.
It's nothing like the quality of the Devpac 68K assemblers - really buggy :(

I'd reckomend you use the motorola or GNU DSP assemblers instead...

Laters,
Craig.

What do you mean by buggy?

Does the assembler/emvironment crash easily/frequently?

Or does it just generate a wierd/inaccurate binary?

> I'd reckomend you use the motorola or GNU DSP assemblers instead...

Thanks for the feedback. I'll look into them.

The assembler didn't support all the op-codes you'd expect, and the debugger was a serious piece of cack - unusable really. I was very disappointed in it, as Devpac 68K was probably the best assembler for the Atari - and it's debugger was pretty good as well, although I did start using the Black Scorpion falcon-only debugger towards the end (an improvement over the Devpac68k debugger in several ways).

I think it had an error for the JMI instruction, which turned out to
some other Jcc instruction in the binary. It took a while to find out
what was wrong with the program. After that, I've only used Motorola's
assembler.

Sounds like it would be better to throw away my DevPac DSP before I
ever used it. Pity since I bought it mainly because I quite liked
DevPac 3.10. BTW, could you tell me what's better at the Black Scorpion
debugger and if the difference is worth the extra money if BSdebug is
still available.

I cann't honestly remember - I haven't used my Falcon in 3 years or more.
I just remember thinking "gee - must buy this" when I saw it at an Atari
show in London, along with a PC keyboard interface, accellerator, NVDI4 and
some virtual memory driver (cann't remember the name, but it wasn't very
reliable).

I tried using the BS debugger for a while, but found it much worse than
DevPac's Mon. Sure, on the surface it is compatible, but none of the neat
features of Mon are in there. The mouse/window stuff in BS could have
been useful, but it isn't used for anything worthwhile and only gets in
the way.

All IMHO, of course.

As soon as I got hold of a version of Mon patched to deal with the '040,
I went back, and I haven't started the BS debugger once since then.

You also could use one of the not so bad free Atari eulators on Mac and do some work with us on EmuTOS, an OpenSource TOS replacement, which now does support most of the BIOS/XBIOS/GEMDOS features of TOS (no GEM). It will (not so much later) work with MiNT (does now!), fVDI and XaAES to give a full graphicle system.

I nthe moment we plan to implement a native execution interface for emulators - mostly in cooperation with the Aranym (Atari running on any platform) folks. Wouldn't you like to help porting Aranym to Mac? This really would be a cool thing. It still does run on Windows.

Have a look at:

http://emutos.sourceforge.net

Hi all,

does someone have a working example of a GFA-Basic program which uses a subroutine written in C? So far I've only seen an Assembler one. The example doesn't have to do much - just printing out "Hello World" would be ok :-).

Greetings,
Matthias

Hi,
Could anyone please tell me where I could download the GNU C Compiler
for the Atari ST? I've searched the web and was unable to find it
anywhere.

Thanks,
Andy Blakely

Hi Johan - 's been a long time :)

Of course, I then wrote my own debugger that ran as a MiNT process, and
that was more useful still ;)

(never released the GUI version, but it was a C source level debugger for
Lattice C - one day I'll get my f030 out of the attic and finish it)

Craig.

Hello all!

We are pleased to announce the HighWire Development Project web site.

URL: http://highwire.atari-users.net

While NO DOWNLOADS are available at this time. There are some screen shots and other info available for those interested. Downloads will be available shortly. This is a chance for non programmers to get an idea of how development is progressing and to book mark the site before the initial release announcements are made.

HighWire is a New Atari Browser that is UNDER development. We are asking anyone interested in helping code HighWire, in C, to join the group. We are also looking for people experienced in translation and documentation, so that the project can be available to as many Atari users as possible. Without any hurdles due to language problems or documentation. Please visit the developer section of the site for information on how to join the list.

HighWire Development Project

In uno strano messaggio del 16 Dec 01 mdoering@mucl.de (2:333/608.1) scrisse
al povero All :
 m> You also could use one of the not so bad free Atari eulators on Mac and

What Atari emulators are there for the Mac ? And how do they compare with
MagiCMac ?

 m> do some work with us on EmuTOS, an OpenSource TOS replacement, which now
..
 m> platform) folks. Wouldn't you like to help porting Aranym to Mac? This

m> really would be a cool thing. It still does run on Windows.

I had a look and it is interesting, but I have little free time and already joined the HighWire development team, as I am interested in the web browsing from my Atari GEM NOS. I do not think it would be a good idea to join another group, I already have too many things to do.

Just one question, the only thing I would need in MagiCMac would be a way to use all the serial ports, eventually USB ports (modem/router) and ethernet.

NOS has its own tcp/ip stack but on MagiCMac can use the only serial port available and this is a limit I would like to jump, if you can put together an emulator where I can drive more serial and network adapters it would be really good, expecially as NOS has its own multitasking and all needed clients and servers.

Ciao, *Mike* mikenews@triesterivista.it www.triesterivista.it

OK, glad to see you've got it up and running!! On a note, especially for
people living in England, is Jeremy Hughs contactable? I'd like to see
 Imagecopy updated, is his address still valid from his Imagecopy manual?

Could someone give me a hand with a checksum calculation for GFA Basic?
I've taken the code from a C source, and tried to compile it with Borland
with no luck. I want to use the code in GFA anyway, but I'm not sure how to
translate some of the commands.

I would read a file into an array patchData(i%)

```
 UBYTE sum  --- what is UBYTE in GFA?

 sum = 0
 FOR i%=0 TO 4096
  sum = (sum + patchData(i%)) MOD (1 << 8)
 NEXT i%                              ^^this means a bitwise shift left
                                        SHL|(1,8)?????

return((UBYTE)((1 << 8) - sum))
```

Thanks in advance!

unsigned byte, meaning 0 to 255
some compilers allow a signed byte ranging from -127 to 128

> sum = 0
> FOR i%=0 TO 4096

I am pretty sure that is a bitwise left shift, it would appear you converted
it correctly to me, however it's been ages since I ported any 'C'.
Perhaps someone into 'C' could futher clearify...

I assume that it is a synonym for "unsigned char"

>
> unsigned byte, meaning 0 to 255
> some compilers allow a signed byte ranging from -127 to 128

128 is not a valid signed character value - bit 7 would be 'on',
meaning 'negative', and being interpreted as -128.

unsigned bytes range from 0..255
signed bytes range from -128..0..127

> > sum = 0

Why didn't you simply replace it with the value 256 instead of "1<<8"
?

Perhaps if the original C code was posted, we could recode it in BASIC
a bit better.

(I haven't seen/used GFA, however, but it should be similar to other
BASICs WRT code algorithms)

OK Here is the original C code:

```
UBYTE MakeChecksum(patchData)
/* Given your array of patch data, compute and return the checksum. */
UBYTE patchData[];
{
UBYTE sum;
int i;

sum = 0;
for (i=0; i<DX_FILESIZE; i++)
sum = (sum + patchData[i]) % (1 << 8);
return((UBYTE)((1 << 8) - sum));
}
```

I've tried to convert it to GFA as follows:

```
sum = 0
FOR i%=0 TO 4096
   sum = (sum + patchData(i%)) MOD (SHL|sum,8)
NEXT i%
```

...but I get a syntax error.

Any suggestions would be appreciated.

```

This bit of code is code is summing all bytes of the the data, while throwing out
all but the bottom 8 bits of data after each accumulation. The (1 << 8) is simply
256. You could accomplish the same thing in C by replacing the "% (1 << 8)"
with "& 0xff" or "& 255". In reality, on all systems that I have ever worked with,
the modulus shouldn't be necessary, as a true UBYTE (unsigned char) can only
store the bottom 8 bits anyway.

```
> return((UBYTE)((1 << 8) - sum));
```

The function then returns the bottom 8 bits of the above determined sum value
subtracted from 256

```
> }
>
> I've tried to convert it to GFA as follows:
>
> sum = 0
> FOR i%=0 TO 4096
>    sum = (sum + patchData(i%)) MOD (SHL|sum,8)
```

I never worked much with GFA but you should be able to replace your
"MOD (SHL|sum,8)" with "MOD 256". Does GFA have a binary AND
operator? If so, you could use "AND 255".

```
> NEXT i%
```

Once you get this far, you would need the final operation:

```
    sum = (256 - sum) MOD 256

>
> ...but I get a syntax error.
```

Does it tell you the location of the syntax error?

```
>
> Any suggestions would be appreciated.
```

I don't rember if GFA has typed data such as UBYTE or "unsigned char", but,
if you are consistent in you MOD's (or AND's) your result should be correct.

```

This looks weird, because it means the array has 4097
elements

If DX_FILESIZE is 4096
> for (i=0; i<DX_FILESIZE; i++)
translates to
FOR i%=0 TO 4095

The actual C source would be useful. ;-)

A C compiler doesn't know what UBYTE is either - it will have to be told. The sensible assumption is UBYTE stands for UnsignedBYTE. Theoretically you need to declare something in GFA which is one byte in size and that is also treated as unsigned. Incidentally, the most likely definition for UBYTE for the C compiler is...

```
typedef unsigned char UBYTE;
```

...you might have that somewhere. Possibly not though (it is equally likely to be defined separate to the C source).

```
> sum = 0
> FOR i%=0 TO 4096
>  sum = (sum + patchData(i%)) MOD (1 << 8)
> NEXT i%                              ^^this means a bitwise shift left
>                                        SHL|(1,8)?????
```

If SHL yields 256 then yes. (1<<8) is the same as writing 256.

```
>return((UBYTE)((1 << 8) - sum))
```

This is (loosely) "256 - sum" truncated to a byte. I do not know the mechanics of how GFA works an expression: trouble may be forthcoming...

A C compiler will silently promote smaller datatypes so that they match larger ones in an expression. Whilst 'sum' might be a byte the literal values '1' and '8' are "int" therefore 'sum' gets turned into an 'int'. The expression is really...

```
return ( (int)1 << (int)8 ) - (int)sum
```

...and the (UBYTE) stuck on the front is there to shut the compiler up (it will be moaning about loss of precision when that 'int' gets truncated to a byte).

Consequently...

```
>  sum = (sum + patchData(i%)) MOD (1 << 8)
```

...may not work should GFA actually do all its calculations using a byte.

Here's one I liberated many years ago from (Atari) source. It somehow found its way into my windoze library and obviously somewhere along the line got some C++ treatment. I'll explain it which may help you translate yours.

```
uint32 FC
CheckSum(
    uint32                  curval,
```

```
    const void  *   const   bp,
    uint32                  n
)
{uint32             v   (curval);
 const uint8    *   p   (static_cast<const uint8*>(bp));
 uint32             i;

 for (i = 0; i < n; i += 1)
     v = v + ( uint32(*p++) ^ uint32(543UL) )
 ;
 return v;
}
```

The 'bp' argument is just a pointer into a block of memory. It is this block of memory that is being checksum'd. The 'n' argument states how many bytes long that block of memory 'bp' is. The first argument 'curval' is usually zero. It exists just case you want to calculate the checksum in lots of little chunks by making the CheckSum() call multiple times - we'll ignore it.

'uint32' is an unsigned 32 bit integer. 'uint8' is exactly the same as UBYTE - an unsigned byte.

The first two lines...

```
{uint32             v   (curval);
 const uint8    *   p   (static_cast<const uint8*>(bp));
```

...for all the junk simply say...

```
v = curval
p = bp
```

...so 'v' is our "running total" and 'p' is the address of the memory location whose byte we about to process. The "for" loop needs no explanation, it just goes through 'n' bytes starting with at location 'p'. The important line does a lot of work when the subtle stuff is taken into account...

```
     v = v + ( uint32(*p++) ^ uint32(543UL) )
```

First off, it reads the byte (*p) then it makes p point to the next byte in memory (*p++). This byte is unsigned but is immediately turned into an unsigned 32 bit value (uint32(*p++)). This intermediate value is saved for a moment whilst the second half is looked at. "543UL" is just 543 stored as an unsigned 32 bit "long" - take this to mean (uint32(543)). This value is then exclusive-or'd (XOR) with the intermediate value (uint32(*p++) ^ uint32(543UL)). The result (still a 32 bit unsigned value) is then added to 'v'.

Incidentally, when it matters I happen to be quite explicit over my "casts". That troublesome line could equally appear as...

```
     v += (*p++ ^ 543UL);
```

In pseudo-code...

```
FUNCTION CheckSum(curval,bp,n) RETURNS uint32
uint32   v    =curval;
uint8   p    =bp;  //array bp[0..n-1]
uint32   mask =543;
uint32  temp;
uint32  i;

FOR i = 0 TO n-1 INCREMENT i BY 1
  temp = p[i]
  temp = temp XOR mask
  v = v + temp
ENDFOR
RETURN v
```

Oh, and I just remembered where I purloined the original code from! A utility called "Splitter".

Thanks for all the replies. I've got the code now so that there aren't any errors, but it's not giving me the results that I want. I think the problem is that there is no equivelent to UBYTE in GFA Basic.

Here is my code:

```
OPEN "I",#1,"E:\KCSOMEGA\4OPDELUX\FOUROPVC\1.DXX"
'
sum%=0
FOR i=0 TO 4095
  sum%=sum%+INP(#1) AND 255
NEXT i
' RETURN  UBYTE (( 1 << 8 ) - sum)
'
PRINT 256-sum%
```

I've tried "sum" as a byte, a word, and an integer. Byte and word values are out of range.

Some info: this is a checksum used by a MIDI synthesizer. I've got some data patches in sysex format with the header and tail stripped off. In order to use the patches I have to calculate the checksum of the data and insert it at the end of the file, as well as restoring the header. I've got no problem restoring the header and the tail but I don't know how to do the checksum. I found this checksum code in C on the internet with comments from various people that it worked. I tried to compile the code using Borland C++ but there were many compiler errors and I don't know anything about C. I've seen this checksum described as "2nd complement (-sum & 127)". On this particular file I know what the checksum should be, and I haven't found any checksum routines that give me what I'm looking for.

I don't recall enough to be sure, but I suspect you might want to do

```
sum%=(sum%+INP(#1)) AND 255
```

instead.

You can define a byte as var|, the vertical bar denotes a byte in gfa.

You also will get different results compiled versus not compiled as compiled
code ignores overflow. If this 'C' code relies on the fact that overflow
is ignored you will have to test it compiled perhaps.

In editor:
b|=255
b|=b|+1 will halt with some error
Compiled however the byte value will simply wrap around to 1 or some value
you don't expect and no error will appear. I have seen programs in the past
rely on such things.

Also you can use value|=BYTE(sum%) for example to fetch just the lower 8
bits of a long or a word.

Dunno if any of this helps.

Thanks to everyone who replied. Guy, I appreciate your thoroughness, even though it's way over my head.

My main problem was that I don't understand the math involved in these bit manipulations. There turns out to to be a method that even I can understand : add up all the data and then subtract 128 repeatedly until the result is less than 128. Then subtract that number from 128.

This may not be very elegant or efficient but it does the job and I can understand what's going on.

```
  OPEN "I",#1,"E:\KCSOMEGA\4OPDELUX\FOUROPVC\1.DXX"
  '
  sum%=0
  FOR i=0 TO 4095
    sum%=sum%+INP(#1)
  NEXT i
  '
  DO UNTIL sum%<128
    sum%=sum%-128
  LOOP
  '
```

```
  RETURN 128-sum%
```

```

Ah, obfusticated code in reverse! All it does is add the byte patchData[i] to the byte held by sum. ie sum+=patchData[i]. Nothing more.

```
>return((UBYTE)((1 << 8) - sum));
```

Ditto. "return -sum";

```
>}
>
>I've tried to convert it to GFA as follows:
>

>NEXT i%
>
>...but I get a syntax error.
>
>Any suggestions would be appreciated.
```

I see it stated elsewhere that GFA has no datatype that can hold an unsigned byte. No matter use declare 'sum' as an integer. You may be able to dispense with some of the AND's but I'll be explicit...

```
sum = ( (sum AND 255) + (patchData[i] AND 255) ) AND 255

return (-sum) AND 255
```

Eg: If you were to make DX_FILESIZE=2 to handle two bytes of data, and those bytes were $01,$02 then you ought to get $FD back from it.

Incidentally, the C code is really old. A modern compiler would
struggle, even with UBYTE defined, unless it had a K&R backwards
compatibility option.

Hi all,
I'm looking for someone who can disassemble, alter and then reassemble a program for me. What I want is to remove several fixed values from within the program to a file and have the program load them from there as this will allow me to change the values as required.

So anyone want to give this a try?.

Stephen Moss

P.S. The program was written for the ST.

The tool you need is Henk's TT-Digger or Easyrider. I'm only running ST in
emulation ATM and don't have all the right kit on this Bill-Box otherwise
I'd offer to have a go myself.

How large a program is it? Adding new code may well make it very
complicated to achieve. A simpler solution may be to check out the
offsets of these values, and fix a program to change these in the
binary, to allow easy modification of the values.

Anyway, I can have a go at it, if I can find a disk with Bugaboo and
my systems still works.

HTH.

Hello,

I will like to use equivalents of Fsfisrt and Fsnexts with Dopendir and
Dreaddir. I read the document developer of Magic but visibly to use mask
of research (* .IMG, * .ICO etc...) it seems less easy. Would someone
have him some routines in C or examples of applications ? Thank you by
advance.

This is what I did recently (I will be short):
after the Dopendir call you cycle with Dxreaddir:

```
     do{
          err = Dxreaddir(128, infoblk->dirhandle, buf, &xattr, &xr);
          if   (xr)
               Log(LOG_ERROR, "Fxattr error: %d", xr);
          if   (err)
          {
               if(err!=-49) /* if not COFF end of reading */
                    Log(LOG_ERROR, "Dreaddir error: %ld", err);
          }
          else
          if   ((xattr.mode & S_IFMT) != S_IFDIR)
          {
               strcpy(buf0,&buf[4]);
               if(1==wildmat(strupr(buf0),infoblk->mask,argv))
               {
                    found=TRUE;
                    Strcpy(infoblk->d_fname, &buf[4]);
                    infoblk->d_length = xattr.size;
                    infoblk->d_attrib = xattr.attr;
                    infoblk->d_date = xattr.mdate;
                    infoblk->d_time = xattr.mtime;
               }
          }
     }while(!err && !found);

     if (err != 0)
     {
          infoblk->errorcode = err;
          if (err == FNF || err == COFF)
               return(NO_MORE_FILES);
          else
               return(FAILURE);
     }
     else
          return(SUCCESS);
```

It should be easy to anderstand that the mask filtering is done with the

function "wildmat" that is defined in the "wildcard matching" module of NOS, it is:

```
/*#define TEST*/
/*
 * @(#)wildmat.c 1.3 87/11/06   Public Domain.
 *
From: rs@mirror.TMC.COM (Rich Salz)
Newsgroups: net.sources
Subject: Small shell-style pattern matcher
Message-ID: <596@mirror.TMC.COM>
Date: 27 Nov 86 00:06:40 GMT

There have been several regular-expression subroutines and one or two
filename-globbing routines in mod.sources.  They handle lots of
complicated patterns.  This small piece of code handles the *?[]\
wildcard characters the way the standard Unix(tm) shells do, with the
addition that "[^.....]" is an inverse character class -- it matches
any character not in the range ".....".  Read the comments for more
info.

For my application, I had first ripped off a copy of the "glob" routine
from within the find(1) source, but that code is bad news:  it recurses
on every character in the pattern.  I'm putting this replacement in the
public domain.  It's small, tight, and iterative.  Compile with -DTEST
to get a test driver.  After you're convinced it works, install in
whatever way is appropriate for you.

I would like to hear of bugs, but am not interested in additions; if I
were, I'd use the code I mentioned above.
*/
/*
**  Do shell-style pattern matching for ?, \, [], and * characters.
**  Might not be robust in face of malformed patterns; e.g., "foo[a-"

Do you know a way to make the gfa compiler work with magicmac ? It give an
address memory error.

Very nice, I was able to run the compiler with MacMiNT, even with the basic incomplete installation, it was worth for something in the end 8^)

Is there any trick to run directly in MagiCMac ? The linker has no problems.

Ciao, ** *Mike* ** www.interware.it/users/mike/

Dunno about vpac3 but this issues "Hello World" to Cconws(). Should be
easy enough to modify...

```
/    module name c

     .shri

     .globl main_
main_:

     .strn

L2:
     .byte    72
     .byte    101
     .byte    108
     .byte    108
```

```
     .byte    111
     .byte    32
     .byte    87
     .byte    111
     .byte    114
     .byte    108
     .byte    100
     .byte    0

     .shri

     link a6, $0
     pea  L2
     moveq    $9, d0
     move d0, -(a7)
     trap $1
     addq $6, a7
     unlk a6
     rts
```

You can remove the 'link/unlk' instructions which, aside from the "stupidity" of all the 'byte' instructions, is a great big clue that the above was generated by a compiler! ;-)

Hi,

Anybody know of a C compiler for the Atari 800 (The original 800, not the XL)? I have certainly seen them for the Atari ST computers, but I can imagine it would be difficult to implement in 48K.
I recently purchased an old 800 on eBay and thought setting up a C compiler for it would be a neat project.

Thanks,
John

Hi John

There was a C compiler available through the antic catalogue. It was called "Deep blue C" there was also a math library that allowed for floating point functions (if I remember it right). I managed to get it on sale just before antic publishing went bust in the early 90's. I'm not sure who originally wrote it or if its available as shareware/freeware or not. I think there was also a shareware version called CC65? I'm not sure if I remember that one correct but it might be available on an ftp site or in someones collection.

Can it be done ? How ?

I have an old program written in GFA basic, sources are lost and I only need to intercept few routines and modify them, so can you suggest how could I patch the program ? I see there are a lot of pathing programs around for updates and fixes, so it should be possible, can anybody give tips about what software to use and how to identify the exact point to intercept and then how to write new code and how to stick it to the old program ????

Thanks very much, it worked 8^)

I still have problems with the interpreter tought I use ALA_CARD, what
version should I use ? Other solutions ? I can use the interpreter in single
mode only.

Patching works the way that you two programs: program a (old) and b (new).
The patch generator generates a patch file which includes the difference
between these two. I've got a patch program for HomePage Penguin updates but
I think that you still need the source code. Without deep knowledge of the
assembler language it's almost impossible to write a patch program for a
program for which sources are lost.

I know of one free patch program: "Diffy/Patchy".

Matthias

I have that deep knowledge of asm, I do not have deep knowledge of how the GFA compiler produces executable, to identify various calls. The second thing is when I know the point I want to "break into" the program, what should I use to stik the code and how ? Suppose I want to add a new routing writing it in C or ASM and compiling it in a binary file, how do I correctly jump in and

out ? I guess I should attach the new code at the end of the old program and then just jump in and out at correct addresses, but what about the stack and other recommendations about GFA ?

Another way would be to disassemble all the program, maybe with TTdigger, until you obtain a working asm source and then recompile all.... can you also help about this way ?

Ciao, ** *Mike* ** www.interware.it/users/mike/ mike@interware.it

Hello Yves,

Yes there is mostly english in here. but I think I've run across french groups too. the best place to find sites that cover atari programming info is just to try your favorite search engine. I have run a cross a few french sites too but forget the addresses unfortunately (I should have saved them I know but I forgot)

Hi,

Just one question.
Is there any possibility to check if my Falcon has CT1, CT2,
Afterburnen, Nemesis or any other accelerator and if it's active or not?
Routine in C would be the best solution for me of course.

--

Regards

Rafal Kawecki

Open the case and have a look what's up. Best way ;)

> Routine in C would be the best solution for me of course.

Sorry, i doasn't know about a routine that check these kind of
accellerators. Best way anyway (my opinion) is to made a software that
do that all. Benchmarks, Ramtest, Displaytest and some else include.

Can't remeber me to see a software that can do that.

Regards, Robert

As far as I know, that is probably the only real way to do it
and it will be alot of work. Since you lost the source
you probably didn't turn on the symbol table option when
you linked it originally. I assume this is a very important
program to you if you would go to this trouble? How big
a binary are you refering to here? I'm curious. ;-)

About the interpreter in the previous msg. If you would prefer
to avoid the gfa interpreter entirely there is a solution.
It is possible to use QED or your favorite text editor to
code gfa programs.
Have a look at my web page, if it interests you just let me know.

Don't now if it can be done directly (without opening up the
machine - which may be the easiest thing to do!) but if you only
want to know whether the Falcon is accelerated, run Profile 2.22.
This will give you something starting like:

```
PROFILE v2.22 by Linnhe Computing - Mark S Baines (c) 1994, 1995, 1997

Hardware, TOS and Display
~~~~~~~~~~~~~~~~~~~~~~~~~
Machine type:                        Falcon030 computer
Central processing unit (CPU):       MC68030 (cookie jar)
Central processing unit (CPU):       MC68030 (hardware test)
CPU speed relative to 8MHz MC68000:  4.37 times (equivalent to 35 MHz)
```

and this speed varies depending on whether there is an accelerator
or not. With Nemesis on Low I get 5.62 times (45 MHz) and with
Nemesis on High 6.75 times (54 MHz).

Note that this program has a problem under MagiC - the sub-menus
don't work and crash the program. But you can see the first page
with the above info as soon as you run the program, and can output
the complete test to a file and read the details from that. The
program was shareware but is now freeware, I think.

>

Well, I'm _not_ trying to make a tester. I'm trying to make a programm, that runs different routines for different accellerators.
First I have to check if there is an accellerator and then call the different routines for different accelerators (or one routine with other parameters).
So, it makes no sens to call Profile or something else to check if there is an accellerator or not. It's simply impossible.

You could try to ask that via email to newbeat@swipnet.se. Hope that
address still exists. They are the creators of "Willie" and as far
as I know "Willie" checked at least for Nemesis.

While reading a recent computer mag, I came across the name "True Basic"

It was the name of a computer programming language and was written in the 1980s by the originators of the Basic language (John Kemeny and Thomas Kurtz)

Was there ever such a language available for the ST?

All the Basics I can recall for the ST are : ST, GFA, Power, Hisoft, First, STOS.

(I've played with "Enhanced" ST, and Hisoft/Power BAISC, but haven't seriously used Basic since I converted to using C [Megamax/Laser/Lattice] in the late 1980s)

scrisse al povero All :
 se> As far as I know, that is probably the only real way to do it
 se> and it will be alot of work. Since you lost the source

Yes I tryed yesterday and I am perfectly able to disassemble and then
recompile in a perfectly equal program. Will have a look if I can trace
routines and do some changes.

 se> you probably didn't turn on the symbol table option when
 se> you linked it originally. I assume this is a very important
 se> program to you if you would go to this trouble? How big
 se> a binary are you refering to here? I'm curious. ;-)

The program is not written by me unfortunately, it's"net2net" that I'm still
using to gateway these messages on my FTN system. The author stopped the
project when his Atari hardware had a failure and was not able to recover any
backup, just at the time he decided to pass me the sources to continue
development. One other guy restarted the project again starting from the
beginning but stopped after the first GFA listings, so I am alone, and it
seems easier to correct small things in the previous software then go on with
the new project, as my system is running for years. Another problem is not
having a debugger working in MagiCMac, having the GFA interpreter or the
PureDebugger working would speed up my development. For many things at the
moment I prefer to use VisualC and standard libraries on a PC, debug the
thing then port the source to the Atari, obviously I can't do anything about
the GEM interface, AES calls and so on.

 se> About the interpreter in the previous msg. If you would prefer
 se> to avoid the gfa interpreter entirely there is a solution.
 se> It is possible to use QED or your favorite text editor to
 se> code gfa programs.
 se> Have a look at my web page, if it interests you just let me know.

I will have a look, but the interesting part of GFA is the "live" editor
itself and the quick way to test the code before compilation.

I recall ads for TRUE Basic for the ST, however I never seen a
single listing or ran into anyone who has it.

Just look at atariuptodate.de for a more or less complete list of basic
languages. Don't forget CPX-Basic - it's the only basic which has been
recently updated :-)

And yes, TrueBasic was available for the ST and the Amiga.

Greetings,
Matthias

Hi,

Why not go for a more "general" approach?
Check CPU type (030 / 040 / 060)
Check for fastram and use it
Run simple benchmark tests on both ramtypes and CPU optimizations

Regards

/Peter Persson

www.cc65.org ansi c cross compiler, runs on linux/windows etc. can compile to
commodore, atari, apple...
help write some libraries!

Does anyone have a fast atari 8 bit divide routine?
The best I found so far is:
---
8 bit unsigned divide

```
ldx #8
lda dividend
div cmp divisor
bcs s
sbc divisor
s rol quotient
rol
dex
bne div
```

timing in cycles:
overhead 5
"0" bit 20
"1" bit 18
range 148 to 164
average 156
unrolled, with dividend in A register, and last iteration optimized: 105

average of 14 cycles per bit.
dividend, quotient, and divisor are 8 bit values stored in zero page.
The remainder is left in A.
note: dividend/divisor must be < 2.

This person mentions two faster methods, one of which uses tables.
Any ideas?

Thank, found and clearly stated it is _shareware_ and that it needs a key
code.

So what ?

Ciao, ** *Mike* ** www.interware.it/users/mike/ mike@interware.it

This is a good idea :-)

>Check for fastram and use it
>

Well, it's also possible :-)

>Run simple benchmark tests on both ramtypes and CPU optimizations
>

I don't want to make any program, that tests the speed. I need to know
if there is or not an accellerator.
So, the idea with checking for CPU and FastRAM is very good.
But there are also such accelerators like Phantom, that don't gives
either new CPU or fastram...

Hi,

I am looking for ideas for a challenging Atari 8-bit assembler programming project. I would like to write something that would be useful to a lot of 8-bit users. Is there something out there that would genuinely be useful, but has been just too tough a nut to crack for anyone to take the effort?

I have about a year of x86 assembler experience and 14+ years of C/C++ experience on the PC platform. I can handle difficult complex programming projects.

I am new to Atari 8-bit computers. As a hobby I have recently started piecing together the Atari system I always wanted has a teenager. I have been having a lot of fun with games, but now I want to start exploring the Atari at a programming level.

8-)

You might consider the MyDos utilities that Andreas requested a couple of
weeks back; it's definitely big and challenging.

Hello,

I'am searching for the Omikron Basic Compiler 3.x, the actual version 5.x seems to work only with 4 MB machines.
Where can I get the Compiler 3.x ?

Ron,

I checked out Andreas's MyDos posting. That looks like a realy good idea. Thanks for the imput.

Thanks,
John

Telnet would be great. It's a key to all the other services.

Hi

Sadly, after many years I have finally got to the point of clearing out my old Atari ST/Falcon stuff. Anyone interested in the following stuff then its yours free

Inshape 3D modeller
Hisoft Devpac DSP
1st Word+
CAB
Hisoft Devpac 3
Personal Finance Manager, MasterCAD, 3D Calc - Michtron
Prospero C Development Toolkit
Technobox Drafter
Twist 2
AtariWorks
Family Roots
LDW Power
Hisoft Basic 2
Calligrapher Gold
Interface 2
FaceValue

Books

Atari ST Machine Language - Abacus
ST BAsic to C - Abacus
Introduction Atari ST Machine Code
The Atari Compendium
Modern Atari System software
Programmers ref manual 68000 - Motorola
DSP56000/56001 Users Manual - Motorola
Atari ST Review 1-12 bound
Loads of ST mags - ST Format, etc c/w cover disks

Regards

Robert Casey, Manchester UK

Hi,

I just started working with the Atari Macro Assembler and the Atari Program-Text Editor. I am new to Atari Assembler. Every time I try to assemble my test source file I get an error on every line. Obviously, I'm missing a concept somewhere 8-).

If someone could post a simple hello world source listing it would help me a lot. I could at least know that the source code was correct and focus on the mechanics of the assembler.

Thanks,
John

I dug out an old eprom programmer, and it was used on an Atari 1040
Mega ST, but have not had the atari for quite a while, I know that it
was made for the parallel port, and the box indicated Atari, Mac, or
the PC. I was wondering If anyones knows where I can get the software
for the pc, the burner is labled a by Hippotamus Software Inc. which I
don't believe it exist anymore, any ideas? or help?

Thanks

Hi Guy's

Has the traffic in here died off or has my feed died, again.

What message flow do you see. My IP is in the midst of 'improvements' and
that usually is a call for me to find another IP!!.

Been ok to me. Sometimes it slows down alittle, but picks up later on.
Right now it is holliday time. I have relatives coming over and
problably will not be on the computer again till Tuesday...

I think it would be really useful to make a library of useful routines,
like disk i/o, setup graphics mode, plot, return model #, cpu speed, fetch
ram pages (including several K amounts of continuous memory), extended and
expanded memory accessed (that is, dma based and i/o page based), sound
access, keyboard read, joystick read, and zero page location request
(again, request several zp in a row).
the reason I say this is cross model and platform compatibility, which can
lead to a C standard library for the cc65.org compiler so that you can
make a nice project and all 8bitters can use it. There are so few 6502
programmers left that we have to gather the strengths of all 8 bit
platforms to proceed as a community.
Just my idea.
I can tell you for sure we would need:

fetchkeyraw - return raw keycode for this machine (atari ascii or whatever)
raw2ascii - convert (as closely as possible) atari ascii to standard ascii

raw2xtra - convert atascii to some kind of standardized extra keys, like F keys which commodore/atari have, cursor keys, etc.
getpage - reserve 256 bytes of memory anywhere and return pointer like $60 means $6000-$60ff
getpages - get N pages continuous (for those who need 1k tables etc.)
getfar - read ram under rom, or ram expansions etc
storefar
howmanyjoy - return # joysticks
readjoyN - read a joystick
readpaddleN - read paddle
writefile - open a standard temp file - call it anything - and close it
readfile - read the file back (can be used as bare minimum to save prefs, highscores etc.)
should save an area of memory, save as 8bit bytes
cpuspeed - return cpu speed in cycles/sec
settimer - start a cycle timer if possible
stoptimer
settimeraddress - where the interrupt starts exectuing
getzp

This is nothing fancy but I know from experience that the bare minimum of routines to make any decent program is access to memory #1, access to timers and input/output, then files, then sound (sound is probalby not essential for most things).
Text modes can be almost exactly the same on good enough platforms - comoodore/atari can have 40x25 text screen, and 80 column text screen can be simulated with this (or real 80 column for commodre 128).
Bare minimum graphics are also compatible, saw black plotting on white in 320x200, this is enough for graphs and so on, but I don't expect this to be amultiplatform gaming thing - though even games can make use of standard joystick/paddle/keyboard/ram access.

Hi,

Thanks, for taking the time to respond to my posting. I really like your idea of a 6502 assembler library. That will let me start with simple objectives and build from there. I have to admit; I have found the Atari 6502 platform a little more difficult to pick up than I had first thought. There are some incredibly powerful assembly tools for the Intel x86 platform that just do not exist on the 6502 platform. However, I have had a few small successes.

I can tell I am farther from tackling a big project than I thought. But, I am undeterred. There is a certain technical aesthetic artistic and historic quality to these machines that I really enjoy.

Anyway, I think the idea of starting small and building a foundation library is a good idea. That is how I plan to proceed at this point.

Thanks,
John

Glad you like it - but, there are some powerful 6502 assemblers, one's even called MASM :) I heard one called ACE by a commodore guy is good, of course you can use it for any 6502. There's an assembler that comes with the C compiler at www.cc65.org as well. All the usual like macros, conditional assembly etc. are available. You should realize also that you can actually count cycles on a 6502 without worrying about cache hits :)
All legal instructions are 2-7 cycles, but most are 2-5. Be aware that accesses to the lower 256 bytes of ram are one cycle faster, and also that's the only place you can store pointers for indirect addressing modes.
Usually it's faster to use absolute mode, to clear ram use sta $1000,y:iny:bne loop
instead of lda #$10:sta $03:ldy #0:sty $02:sta ($03),y:iny:bne loop
or even sta $1000,y:sta $1080,y:iny:bpl loop
If you have any questions about learning 6502 plz post.
good luck
ps if you start writing and then post your code, I can help you optimize it then you can learn some tricks from our land.

Well it took yet another new IP but I'm back for a while. How nice it is to
see news from this September. Now where's that tosser Dave??.

is it possible do write 6502 assembler code on a real pc, compile it
with a real pc and just run it on some emulated enviroment just like
the atari800win? If so, it could be easier to do more complex programs
and also faster I think.

What software is needed to do this task?

bye sayz:

Yes. I used to use TASM from Speech Technology<?> on occasion. I first
started using it on an ~8 MHz Tandy 1000. It was an OK environment, 80
column editing, file I/O on a IBM vs Atari 1050 was probably 100 times
faster. The assembler itself was probably 10 times faster then ASM/ED cart.

Some of the code I wrote, I ran on Xformer to test Xformer/emulator more
then I wanted to run an emulator, but I could have done everything on a PC.

My problems with a set up like that were pretty specific to me and the way I work. I like to use a combination of things like BASIC to make data files and altered character sets for inclusion in my ML stuff. Having 1/2 the program files on either a 1050 or .ATR and the other half on the IBM made for some problems with moving them around. It was always just much easier do everything on a real Atari.

Well as it transpires I've had to sign up to yet another IP and this seems to have cured the problem, as I now get current traffic. '

Hi all,

I have a large Atari BASIC program that I am going to be entering from a book by hand. Sound familiar? Anyone... Anyone...

I would rather key this program into a full screen text editor on my PC and transfer it over to my Atari 800. Which I can do. I have Steve Tuckers APE software and a SIO2PC cable.

Can Atari BASIC use an ASCII text source file? I have looked at BASIC programs that I have keyed into the BASIC interpreter and save them to disk. They are not saved in a text format. I am not sure what format that are save in, frankly.

Any ideas?

Thanks,
John

Hi all,

I am working my way through the Richard Mansfield book; Machine Language for Beginners (c)1983. As anybody got the Atari source code for the SIMPLE ASSEMBLER already keyed in. If you do could you either post it to this news group or e-mail it to me. It would be greatly appreciated.

An .ATR disk image would be awesome!

Thanks much,
John

This should be a faq of some type! Yes you can develop completely on PC. I do for
the c64. Someone else here should have answered by now, as I'm no expert on Atari,
but the basic setup is notepad to write code, a command line assembler (use doskey,
then it's two keypresses to reassemble), then convert the binary into the right
format to load into the emulator (in my case I found an assembler that directly
creates emulator type files), then attach the image in the emulator - at least for
commodre emulators, you have a simulation of a disk or tape as an image file, once
you attach that file then you can load programs off that file through the emulated
machine, in my case I attach test.d64 as a disk image, then in the 64 itself type
LOAD "assembler",8,1 and start it with SYS49152.
I don't really know how to do the equivalent in Atari, but to run assembly programs
on Atari I used to POKE data into $600 or 1536 and they type DOS as that would start
the program. Problem is, this is meant to start a menu program that lets you access
your disk drive, but I never had a real disk drive. The other way to start assembly
from basic is the usr(x) function. If you check a memory map, there's a USR vector,
you poke that with the start address of your routine, then type x=usr(1) in basic.
The "1" gets copied as a 16bit value somewhere if you need to use it, then your
routine is called, and you can pass a value back.
Is there a SYS command in atari basic?

Several options, John...
First Atari Basic *cannot* use ascii because it is line oriented and would never find the $9B end of line.

However, TextPro likes them just fine and has a global replace mode; you can do Ctrl-G to convert Esc, Ctrl-M, Esc, Ctrl-J to Esc, Ctrl-LeftArrow and it cahanges all to Atari Return's. Save it back out and then ENTER it into A8 Basic as a LISTed file.

Another handy utility is Ken Sider's W95 Image manager; it allows you to import/export files to the .ATR in binary or translated text format. All that remains are the inverse and control character stuff to clean it up.

Main thing is to pretty much stay with the LISTed files, although I have also typed in WordPad, import translated text to the .ATR, ENTER into A8 Basic on emulator, SAVE tokenized file back to .ATR, export binary file from image, AtariLink the file to a SSDD disk and LOAD it on a real 8-bit... whew!

Hi!

For those of you, who are interested in coding operating systems for
the Atari or it's emulators EmuTOS could be interesting:

EmuTOS is a singleuser singletasking operating system for Atari ST
computer emulators. Today it is just running on STonX. But my

intention is to have it running on every Atari ST emulator available
some day.

It is thought as a replacement for the TOS-images you usually need
today on these emulators.

EmuTOS is based on Digital Research's GEMDOS sources, which was made
available under GPL license in 1999 by Caldera, and so is EmuTOS.

You will find it at:

http://www.mucl.de/~mdoering/emutos/en

You can poke into page six, but execution is X=USR(1536) to start running at

that address; the USR(addr) is essentially our implementation of the SYS command.

USR(addr[,P1, P2..]) is *not* a vector; it is a function that acts on the first parameter in the parenthesis as an address for machine code execution. Any second and following optional parameters are converted to 16 bit numbers and placed on the 6502 stack; your routine must clean the stack before the RTS back to Basic.

Typing 'DOS' will *not* execute code in page 6 unless you put the '1536' address into page zero locations 10-11 which is the vector Basic looks at to find where to run the file management system program.

Keith Ledbetter performed all his code on a PC, then converted it to
Atari 8-bit, this came with a licensee to use when I bought the right to
BBS Express! Professional. check with Lance Ringquist of Video 61,
perhaps he can help you with the cross assembler?

John;

That is a good book; my dog-eared copy is nearly falling apart. Be cautious; IIRC, their explanations of the BCS and BCC instructions were exactly reversed.

You can sure learn a lot by going thru their code and typing it into the system, but I would recommend Synassembler, Mac/65 or the Atari MacroAssembler for any serious development work on the A8. The old ASMED cart is even not bad to learn on with its fairly adequate monitor/debugger.

Why not scan the book, OCR it and merge the texts into a single file and
load it into your basic editor/compiler.

Hi!
I'm new on this group and I don't that this group is about Atari Portfolio
or not?
Meanwhile I have a question: how can i do an vblank synchronization at
Portfolio in assembler?
And second: does Portfolio uses ports (in/out instructions) such as each PC?

I'd have thought someone else would have answered this! I'll try but
it's been a long time...

Do you need to top a specific program or just ensure yours isn't the
top one? For the latter there's a message (possibly xx_BDROPPED
xx_BOTTOM?) that will send your window to the back. For the former, I
can't remember if there's a better way than sending the relevent
window a WM_TOP(PED) message as though you were the desktop (app might
ignore it otherwise - indeed no guarantee anyway). There's a couple of
calls that allow you to "iterate" the processes & obtain the
information. Sadly I can't remember the names of the calls at this
time. :-(

Possibly...

Why not join Matthias Belitz's ASPI project?
OK, so the BlackBox version is ready, that leaves quite a few other SCSI or IDE interfaces.

CU   Mathy van Nisselroy

PS ASPI (advanced SCSI Programming Interface. But it's really software!!) eliminates the need to write all the tools for all the different hardware devices in that it separates hardware specific code from non-hardware specific code. That way, you can use for instance my CD Audio Player utility on a BlackBox with the BlackBox version of ASPI, and on a MIO or KPI or MSC-IDE controller if we had ASPI software it.

Hi!

GH>Do you need to top a specific program or just ensure yours isn't the
GH>top one?
GH>[...]
GH>For the former, I can't remember if there's a better way than sending
GH>the relevent window a WM_TOP(PED) message as though you were the
GH>desktop (app might ignore it otherwise - indeed no guarantee anyway).
That way you will not be able to top programs without an opened window.
There's a better way:
For N.AES you can use appl_control(), for MagiC there is an undocumented(?)
message you have to send to the screen manager:

```
msg[0] = SM_M_SPECIAL;    /* 101 */
msg[1] = your_id;
msg[2] = 0;
msg[3] = 0;
msg[4] = 'MA';
msg[5] = 'GX';
msg[6] = SMC_SWITCH;   /* 2 */
msg[7] = new_top_app_id;
```

Somewhere I have a TSR which provides appl_control() under MagiC...

Bye

Joerg

Thanks! That worked only insofar that the menu of the application was topped, not the window, though. But I realize it's no good if you don't know which window to top exactly. Is there a way to find out? I guess it will be application dependent. I'm specifically concerned with CAB. I send it a file to open, with shel_write if it isn't running and with appl_write if it is. Is there a way to find out which window I then have to top?

Hi,

Hi if the application has a window open, you could top this window.
To go through the window stack, you can use following process (untested!)

```
******************************
     wind_get(0,WF_TOP,&topwindow,&owner,&next_window,&dummy);

     while((owner!=ap_id_of_desired_program)&&(top_windo!=0))
     {
          top_window=next_window;

wind_get(top_window,WF_OWNER,&owner,&is_open,&previous_window,&next_window);
     }
     if(top_window!=0)
     {
          wind_set(top_window,WF_TOP,top_window,0,0,0);
     }
******************************
```

As I said, this works only if the application has a window opened.

I just found a much better way:

```
******************************
     wind_set(-1,WF_TOP,ap_id_of_desired_program,0,0,0);
******************************
```

This feature is only available with MagiC 4 and later versions.

Good Luck
Philipp

Hi,

I am looking for any software that will let me decompile/extract the source
for my old Atari Xl games I have on floopy disk.
I had a whole bunch of programmes a few months ago when I was supposed to
decompile Mountain King for a few people (but my floppy drive broke and I
lost the apps).

I want to document the code for all the games I own (300+) and display them
in txt file formate on a new web page i'm creating.

Also, is it legal in this case (atari XL) to post the code for these games?
I know the jaguar is open source but i'm not sure about the issues regarding
all other systems/games.

3Y3

Any links or info would be much appreciated,

None of this works. Not by a long shot. :)

Just visit the http://www.atarimax.com/ there is an link for DIS6502 the
best disassembler for XL/XE on PC....

What are you're plans? Disassembling 300 programs? Are that your programs?
What's the reason...

I am very curious...

I have approx 350 Atari games on floppy disk that I play on my Atari XL system. I have been asked on several occasion by many people If i could send them code for certain games (such as mountain king). I plan to disassemble each game and post the source code on a site i'm creating for easy access. Cetain games I will not decompile certain games due to legal tradmarks (such as starwars, star trek ect..)

This will be mainly to help promote preservation of older games so that they do not become unplayable as new hardware makes the older stuff even more obsolete. I wont be making any of them into ROMS (which some people wanted me to do), this will be rather a programming reference as well as a site for atari information.

I just want to offer a site where atari fans come come and learn more about the system and the programming that went into creating these great games. (i'm even thinking about having a simple version of BASIC on the site, so people can try doing a few simple programming tutorials without having to download the emulator or own the system.)

Hi 3Y3

> Also, is it legal in this case (atari XL) to post the code for these
games?
> I know the jaguar is open source but i'm not sure about the issues
regarding

> all other systems/games.

The act of decompiling the code is illegal, its theft of intellectual
property. Posting it compounds the issue.

Hi Jos!

JDB>I send it a file to open, with shel_write if it isn't running and
JDB>with appl_write if it is. Is there a way to find out which window I
JDB>then have to top?
The only thing you can do is to top the front most window of the application.
You can get it by walking through the window stack with wind_get(WF_OWNER)
Everything else will be application dependent or not reliable

Bye

Joerg

>Everything else will be application dependent or not reliable

Thanks. That's exactly what I'm doing now. Still, I can't find a way
to walk throught the window stack and the window stack only. The way
suggested by Philip Donz[illegible]
(wind_get(...,WF_OWNER,...,&previous_window,&next_window,..) doesn't
work. I don't get any workable values in the other ints.

What I do now is

```
for(i=1;i<100/*big enough*/;i++)
{
  wind_get(i,WF_OWNER,&owner);
  if (owner==id)
    break;
}
```

but it seems so dumm and brute-force like...

Hi,

I think you mean DSP. Most falcon specific program uses it, and you can find
the specs on Motorolas website.

Regards

/Peter

Hi,

Here is some code I worked out. (It uses most MagiC specific features!)
With my configuration everything works fine (PureC 1.1, MT_AES.LIB).

Good luck ;-)

Philipp

```
------------------------
#include <mt_aes.h>

#define  NULL  ((void *)0L)

/*
   These defines are already in <mt_aes.h> included.
   I add them only because some people don't use this library and so
   they don't have these constants defined.
#define  WF_OWNER       20
#define  WF_M_WINDLIST  102
*/
```

```
int ap_id;

/*
   This function uses a lot MagiC specific function calls!
      1. Ask for the window list pointer (=You'll get a pointer to the
         complete list)
      2. Switch the menu bar to the selected appl.
*/
void top_appl_MGX(int id)
{
int whandle,owner,is_open,below_whandle,above_whandle;
int *window_list=NULL;
int j=0;
int start_window=-1;

   /* Ask for a pointer to the window list   */
   if((wind_get_ptr(0,WF_M_WINDLIST,(void **)&window_list)==0) ||
         (window_list==NULL))
      return;

   /* Walk through the list until we reach the bottom window   */
   while(window_list[j])
      j++;

   j--;

   while(j>=0)
   {
      whandle=window_list[j];

      wind_get(whandle,WF_OWNER,&owner,&is_open,&above_whandle,&below_whandle);
/*
      printf("whandle=%d owner=%d is_open=%d above_whandle=%d
below_whandle=%d\n",whandle,owner,is_open,above_whandle,below_whandle);
*/
      if(owner==id)                 /* This window is part of the application?
*/
      {
         if(start_window<0)         /* Is this the first window we found?  */
            start_window=whandle;   /* ...prevent an endless loop */

         wind_set_int(whandle,WF_TOP,0);  /* top this window   */
      }
      else
         j--;
   }

   wind_set_int(-1,WF_TOP,id);      /* set menu bar to application <id> */
}

int main(void)
{
```

```
   ap_id=appl_init();               /* initialize AES environment */
   if(ap_id<0)
      return(-1);                   /* return an error value   */

   top_appl_MGX(8);                 /* Top application with id 8  */

   appl_exit();                     /* exit AES environment */
   return(0);                       /* return a "no error" value  */
}
```

I have some old PC code that uses a flydial library, is there any C source
around to replace the flying dialogs ? Maybe something more MagiC friendly,
ie that draws windows instead of dialogs.

This feature is not present on old systems. You can check for it's presence
by
JDB>What I do now is
JDB>
JDB>for(i=1;i<100/*big enough*/;i++)
JDB>{
JDB>wind_get(i,WF_OWNER,&owner); if (owner==id) break;
JDB>}
JDB>
JDB>but it seems so dumm and brute-force like...
I wouldn't do that. The result of this code is a (for the user) unpredictable
behaviour (which is a big NO for ergonomic software). IMO it's better to let
the user explicitly top the window he wants than to "randomly" top one

And a rather ignorant point of view which solves many problems with
compatibility issues is this one:
Modern software requires a modern OS.
No modern OS -> no modern software/features

Bye

Joerg

I was thinking about this to recently (OCR book to atari), As I dont have an
atari no more ,any chance one of the emulators could cut-n-paste into basic
or any other ideas to OCR & transfer to an atari image basic file?

There's a couple of toolkits around, or was. The one I'm thinking of
also supported GFA but its name escapes me - I've got "EGEM" stuck in
my head.

Failing that, I recently uploaded "lib.zip" to my site - follow the

[Atari->Programming] link. Take a look at "g/FORM/formprin.c" the body of which is reproduced below. Looking at the code it is apparent to me that the lib.zip I recovered came from a time just after I got MagiC and is a "development", rather than a "release" version.

```
#define  DEF_BOXCHAR
#define  DEF_VDI
#include <gem.h>
#include <evnt.h>
#include <libc.h>
#include <magx.h>

static void
redraw(l,ob)
int  l;
OBJECT   ob[];
{int wki[5];

 wind_update(BEG_UPDATE);
 wind_update(BEG_MCTRL);
 wind_get(l,WF_FIRSTXYWH,
     &wki[1],&wki[2],&wki[3],&wki[4]
     )
 ;
 while (wki[3] && wki[4])   {
     objc_draw(ob,ROOT,MAX_DEPTH,
          wki[1],wki[2],wki[3],wki[4]
          )
     ;
     wind_get(l,WF_NEXTXYWH,
          &wki[1],&wki[2],&wki[3],&wki[4]
          )
     ;
 }
 wind_update(END_MCTRL);

#define  WID  1
#define  DEP  1
#define  BUT  1

bool
Form_Printf(x,y,b,r)
int  x,y;
int  b;
char **r;
/*[  bool form_printf(x,y,b,r)
     int  x,y;
     int  b;
     char **r;
```

```
Revamped Form_Printf(). This one should be truly rez independent.
x,y are the form position at which to appear, passing NIL for
x or y centers on that axis.

'b' is passed as zero or a positive value. A positive value
results in a button which counts down for 'b seconds' then
automatically returns. Passing a zero value results in a normal
'ok' button.

The form is elaborated a little when 16+ colours are detected.
Form_Printf() returns false for failure, true for success.

Hi,

I'm not sure if it's the right group to send the question, but...

Is there any limit (under SingleTOS) of maximum files I can open?

I'm trying to open some files from my apps and after about 15-16 files
the system can't open any other file.
So, is it a problem of system (is there a patch for that?), or a problem
of my language (pure C) or something else (what?) ?

As far as i know (i havn't done it but a pal of mine did something similar)
you can do this.

Of course just copying and pasting the code into basic will not do it, as in some cases you might need the actual sprite files (but most often the sprite data would have been coded into all that code your pasting).

I'll have some code available on a web site thats in development by the end of november. I'll post the link if anyone is interested then.

It is a snap... clean up the OCR scan in WordPad or any editor you can
search and replace ones for lower case L's or upper case I's and zeros for
upper case O's.

Next use Ken Siders Atari Utility for Windows to insert the file into an
.ATR image and ENTER it into A8 Basic on your emulator. If you did a fair
cleanup job, you will have only a few error lines displayed. If you have
more than one screen full, then LIST it out to a file, and bring it up in
TextPro to search for 'ERR' and fix the lines. After you have it checked by
DCheck or Typo you can SAVE the code to a tokenized file.

It's a limit of the given OS, each version of the OS could have
different limits on total open files. At least the compendium
says this, I cannot find what the limits are however. Perhaps
someone else knows where to find this info.

Yes there is a limit.
The limit depends on the machine
On a ST it was about 70-100 (i forgot the actual amount)

So you have a Falcon ?
On a Falcon it was 18 0r 19

On a TT about 70

As far as i know there is no patch for this.

Heh heh... I said to my wife last night that I thought the sharks were rising up against us. Kinda like that dolphin episode of The Simpsons!

Hello,
I would like to start programming with my old Atari ST again :)
I used just STOS and assembler back in old days, but today I wold
like to use C/C++.
BUT where I can find decent C compiler for ST. Preferably somekind of
cross compiler, so I can write and compile programs with PC , and then
transfer them to ST.

Well,
I thought Florida was a big/great park for the tourists... ;-)
Or some playground for various weather types, like Tornados, Hurricanes,
etc.

I downloaded Pure C from the www somewhere. I am not sure how it
compares what else is out there, but I am sure there is something better.

If you can use the gcc, if you have LINUX or UNIX.

What was "Omikron Basic" like?

All the ST language discs (admittedly either UK or US oriented) I've seen have either had ST Basic (either original or the Metacomco "Enhanced" version), or, if you go far enough back, you'd also get ST Logo.

(BTW: I've added "comp.sys.atari.programmer" to the newsgroup list, as this may also be of some help)

Omikron Basic can use libraries (there were a lot of them e.g. the
Easy-GEM-Lib), can run with or without line numbers and has a
pseudo-GEM-Interface. However, at that time GFA-Basic was already too
popular. Omikron is more similar to the classic basic.

There was a version 5 with a GEM editor and horrible looking dialog boxes.

I forgot to mention that the decision to replace ST-Basic with Omikron was
made by Atari Germany - maybe because the Atari market in Germany was
different to the UK/US one.

Do any of you have a "wish list" for features/functions to be added to my Toolbox DLL manager?

For example, I'm thinking of adding a "Call logging" capability, to help a programmer to see the sequence of calls that lead up to a crash/bug/"feature". This will probably be done as a "log calls to me" flag added to the library load/link phase. And possibly a "Always/never log calls to library [x]" CPX that'll allow a user to configure this.

I'm also reworking the Library List accessory ATM.

If any of you are using compilers other than Lattice C, feel free to edit the include and source files within the archive and send them to me - I'll add them to the next release of the Toolbox.

--

Download the latest DLL manager for the Atari ST. Visit my web page at http://www.atari.net.nz/gem and download the Toolbox today!

Is there anything like Windows (norton/Volkov/whatever) Commander running on the Atari, ahem with MagiCMac ? There are various archive programs (shells) like Twoinone, STZip, with the two filelist window, but what about a file utility ? Maybe Kobold, but does it work with MagiCMac ?

Best it would be an open project, and put in comparing directories and other features. I'm ready to put my hands in such a project if you can give a starting point, as I do not have so much time to start from "Hello World!".

Ciao, ** *Mike* ** www.interware.it/users/mike/

I know a program with name "M>DESK". The last version must be the
version 1.32 and I have the german version on my file archive.

> Maybe Kobold, but does it work with MagiCMac ?

Yes, the last version 3.5x should be works with MM

iirc Kobold ran/runs on MagiCPC with GEMDOS mode enabled.

In uno strano messaggio del 21 Jul 01 swamp-dog@ntlworld.com (2:333/608.1)
scrisse al povero All :
 s> iirc Kobold ran/runs on MagiCPC with GEMDOS mode enabled.

Mmmmmm Kobold is a good program with good selection features, tought it has
no directory sinchronization.

But I could only test an old Kobold 3, all in german, it works in MagiCMac,
but the risk to do something wrong with the files is high, as I do not
understand the german messages.

Again it would be best to have an open source project, or get the source for
programs like kobold, even an old version, as a starting point.

Windows Commander is really a nice program 8^)

Ciao, ** *Mike* ** www.interware.it/users/mike/ mike@interware.it

Hello

What editor is the best to use with Pure C? i'm meaning a modern editor.

Thanks
D Galvez

Hi everyone!

I look for Atari ST programming material. I want to know about the architecture, structure and principles of TOS and GEM. I also want to know how to program using the OS in C or assembler. Are there any resources on the web which describes this? I haven't found any. :(Please point out a direction for me.

Thanks in advance.

Last time I looked the Atari Compedium was online on the WWW. Try the
site below:

http://www.sysop.cuprum.com.pl/compendium/html/toc.htm

At the Steem Emulator site there is much HW-documentation.

I look for the following official documentation from ATARI:

TOS Release Notes 20/5/88
Rainbow Tos Release Notes 7/8/89
STE TOS Release Notes 11/9/89
ATARI STE Developer Information Addendum
AHDI 3.00 Release Notes 4/5/89
Still Another Line A Document. 17/12/87
Intelligent Keyboard (ikbd) Protocol. 26/2/85

Anybody has it!

scaneed copy?

paper copy?

Thank you!!!

I've tryed various solutions posted in newsgroups in the past, but never
managed to use the PureC debugger with MagicMac, can anybody please explain
what should I do ? And how does Templemon work ? It's hard for me to read
german so I'm still going on putting a lot of printf for debug logging in my
Lattice and PureC programs.

For the last year, I have been looking for a copy of the book: Zap! The rise and fall of Atari by Scott Cohen. It has been almost impossible to find....until two weeks ago. I was on Amazon.com and found two used copies....yes...but they wanted 97.50 and 172.50 for them. I want the book.....but not that bad. Well...to cut the story short, I found this Web site that will make you a copy of the book...yes..they actually make it when you order it...for $16 bucks. Keep in mind, its not the original...but a copy of the book. The girl I talked to there said that they have agreements with authors to re-publish their work...without the author having to invest thousands of dollars to have multiple copies made. She said that they make the book when a customer orders one. I assume that Scott realized there still was a demand for this book.....so he used this firm to get it back in the market. Get your copy today!!!

> is how do I correctly undo this?

Before doing the Fforce(), Fdup() stdout and save this handle. Now Fforce() stdout to your file handle, output stuff, then Fforce() stdout back to the handle Fdup() gave you. That's it.

But bear in mind that prior to TOS 1.04, using Fforce() and Fdup() may cause serious problems, especially when used in connection with Pexec().

Ciao

Thomas

A good question!
I wanted to do that with XaAES's debug output. To no avail.
The unredirect, that is.

Hello,

On 31 Jul 2001, Thomas Binder wrote:

> Before doing the Fforce(), Fdup() stdout and save this handle. Now
> Fforce() stdout to your file handle, output stuff, then Fforce() stdout
> back to the handle Fdup() gave you. That's it.

Ah. I looked into fdup(), it mentioned it could be used to restore
a standard device, but for some reason I just didn't get it. ;-)
This seems to work, thanks!

One more question, maybe a silly one. After I fforce() stdout

back to the handle fdup() gave me earlier, should I fclose() this
handle? I think this is were my initial confusion about fdup()
came from because it's a user handle (>6).

> But bear in mind that prior to TOS 1.04, using Fforce() and Fdup() may
> cause serious problems, especially when used in connection with Pexec().

Hello!

> One more question, maybe a silly one. After I fforce() stdout
> back to the handle fdup() gave me earlier, should I fclose() this
> handle?

You should close all handles you don't need any longer.

> I think this is were my initial confusion about fdup()
> came from because it's a user handle (>6).

Fforce() and Fdup() do nearly the same. The difference ist that Fforce()
redirect to the specified handle and automatically close an existing
handle.

Can anybody tell me what is MacMiNT how does it work, if sources are
available, what is the actual development state and so on ? I would really
like to consider an alternative OS to MagiCMac but having the sources to
modify myself.

Ciao, ** *Mike* ** www.interware.it/users/mike/ mike@interware.it

In my ignorance, I will state that MacMiNT is something like JET (Just
Enough TOS). Very briefly stated, the designer required a bare minimum
TOS operating enviroment for a few MiNT compiled applications. The
package and sources are available on most FTP servers to ponder over
and test your skills. If your a Mac user, MagiCMac would be the way to
go. If your an Atari developer, then you will go your own way:)
Mike

What is a good up to date resource editor to use. At this moment I'm
working with RCS30.PRG a beta from Digital Research released once by
Atari I believe. I'm looking for a better one.

With RCS30.PRG sometimes when I use this to edit resource files from newer
programs, strange things happen. Even if I just load and re-save the
RSC file without changing anything, something seems to change, and the
program doesn't work correctly anymore.

Try the KResource RCS program...you can download it from:

<http://groups.yahoo.com/group/atari-midi/files/Programming/Kresorce.zip>

I am working on creating a .pdf (Acrobat) file of the docs for this
resource editor...but the going is slow because I do *not* have the
Adobe tools... Let me know if you are interested, and I can inform
you when I get it done...

That's almost as outdated as RCS30 and shouldn't be used today - Gerd H⍰ller
has the distribution rights for Interface, contact him at hallo@hadley.de.

Greetings,
Matthias

The most up-to-date resource file editor is ResourceMaster 3.20, sold by ASH.
ATM it's in German, with a DDP release of an English resource expected.

The next best is Interface, once commercial but now available on the web for
download:

http://www.hadley.dusnet.de/gfa-basic/dateien/intrf233.zip

You can find the English resource file on my web site, MISC section.

It won't load some resource files from the most modern applications, only
ResourceMaster.

Is there anybody who tested the HighWire project ? As I work in MagiCMac and avoid the crashing Lattice IDE I prefer to use a makefile for the project, but HighWire has source files with longnames, and make.ttp does not work with them, of course I am able to compile modules one by one, or rename the sourcefiles, but I would really like to see if anybody has a make.ttp working with longfilenames in MagiC, maybe a make from MiNT/gcc packages ?

Can you help ?

Ciao, ** *Mike* ** www.interware.it/users/mike/ mike@interware.it

I will try it. Language shouldn't be a problem. I'm dutch, living 20
minutes from the German border. I can understand both English and
German programs. Very useful in the Atari world!

:-(

The site seems to be down. I've located another source for Interface, and I'll have uploaded the amended MISC page by the time that you read this.

Thanks for the bug report.

Ups... I wanted to write $FFFF8006 !

I own the Atari Compendium on CD. But I didn't find a hardware register
list!
Where did you find this information?

I'm just wondering how TOS knows what machine it's running on.
I'd like to understand how TOS works and how I have to interpret the
informations.
```

For example yesterday I learnt how TOS is handling the NVM Memory and
how
it is accessing it (Registers, Checksumm,...). I think this gives me a
totaly new view of my Falcon030. (I'd also like to write my own OS).

Hi,

does anyone want to offer me a copy of his Omikron Basic Compiler for
download? Over 50$ is quite a high price.

Cya

It is compiled in (at least on Falcon and TT).

TOS 2.06 does some hardware detection to run on both ST and STE.

Hello !

I have happily used Devpac, since i know of it.

Here's my question; how can i control the Dev
Pacs Debugger, i think it is called just Mon.

Specially i want to go through a programm
step by step and see how memory changes.

how can i realize that with devpacs mon ?

thank you very much, cause i can`t find
a programms error.

Ravi

I'm sure this had become freeware the last time I looked (a good couple of
years ago). Sorry I can't remember the site.

Outgoing mail is certified Virus Free.
Checked by AVG anti-virus system (http://www.grisoft.com).

I think our "Anonymous" friend is right. http://www.berkhan.com/ sells

the latest version of Omikron Basic for 199 German Marks = about 90 $.
If there's a (older) freeware-version I would be interested, too.

CU Christian

Hi Ravi

>I have happily used Devpac, since i know of it.

A brilliant piece of software. I got my first copy of version 2 off of a cover disk and upgraded to version 3 very shortly afterwards and have since spent many a happy hour hitting my head against a wall!. :-)

>Here's my question; how can i control the Dev Pacs Debugger, i think it
>is called just Mon.

>Specially i want to go through a programm step by step and see how
>memory changes.

 RTFM !!!!

If youve got a legit copy then you'l have documentation that tells you how mon operates in relation to GEN_ST.

Hi Anonymous

>does anyone want to offer me a copy of his Omikron Basic Compiler for
>download? Over 50$ is quite a high price.

I'm not suprised its $50, you can blame that on the wankers that steal
copies instead if buying legally!. Oh!, thats you inst it?.

al povero All :
 ra> Here's my question; how can i control the Dev
 ra> Pacs Debugger, i think it is called just Mon.

It is not very simple as mon is all keyboard driven with a lot of key
combinations corresponding to the various functions.... the result is you
must open the manual and read it or will not take out much.

I think my memory may be playing tricks again! Perhaps it was the Omikron
assembler which became freeware.

Hi all,

After a few requests, we decided to make a SDK CD with the following:

- The GCC kit
- GCC Shell, registered version
- Ressource Master, registered version, with paper manual
- Windom libraries with their printed documentation (200 pages)
- EZ Edit text editor (with syntax "colourisation")
- Many development libraries
- Many development tools

All this for only 49.00 Euros!

(reminder: for active developers the price remains 75.00 Euros for the
SDK including MagiC).

Have a look at the MagiC SDK page (in French):
http://www.europe-shareware.org/atari/logiciels/magic_sdk.html

Best regards,
P. Ricard (ES)

Crystal clear internal structure. Everything defined in header file.
All kind of diagnostic is therefore possible. A rudimentary routine for detecting memory leaks is included. (solved a few in XaAES :-)

It handles completely disjunct chains of Gemdos blocks for each thread.

Each chain can have different chunk size and memory type (global, shared, private, you name it) Chunk size can be changed dynamically to meet changing workloads.

A chain is defined by a root structure that you can start in the local name space of your thread.

If a request is larger than the chunksize, a multiple of the chunksize is allocated. This can reduce fragmentation dramatically.
Resulting slack space is not wasted but normally used by malloc (the call that allocates the smaller portions within a chunk)

The root structure is passed to all malloc calls for the same thread.
A chain or 'memory thread' is defined by this root structure.
This makes its implementation independent of OS in use. No OS related entities like 'pid number' are used.

It is moderately fast. Not as fast as Pure C malloc, but faster than I found in the
mintlib.

It has ran for half a year in XaAES now without any problem.

You can download it from my homepage via the XaAES link and XaAES_nnn_source
It is in the folder xmemory.

It is for programmers, so the source is its own documentation.
C'mon, it is only a few A4 pages. ;-)

Hello,

  in article <Djd_6.6$Ap5.15511677@news2.randori.com> (comp.sys.atari.programmer)

Wavemaker wrote on Wed 27-06-2001 04:30 (GMT):

> I was wondering if there is a C++ compiler for the Atari ST computer. Preferably
> one with an IDE.

There is GCC. It's free and available on the web. It's the most
versatile one and the only one capable of C++ AFAIK (I'm not a C
programmer yet). It's a little bit memory hungry, 14 MB and a "fast"
machine are recommended (Falcon, TT or up). Have a look at this page:
http://gemtos.free.fr/

A GCC SDK is available on CD at Europe Shareware for 49 Euros, including
some registered shareware tools, and for 99 Euros with MagiC (75 Euros
with MagiC if you are an active developper). Have a look at this page:
http://www.europe-shareware.org/atari/logiciels/magic_sdk.html

Most of these pages are in French, a few are in English though.

Best regards,
P. Ricard (ES)

Hi all,

Is there anybody that is thinking to compile GCC 3.0 for
ATARI platforms ? I know, it is only been released since
18 of june, and my question may be premature, but I think

it would worth it.

Best regards,

Hello !

a new release of my C library GSlib in now available.
GSlib02 = GemScript library patch level 02

GSlib is a windom extension (http://windom.free.fr).

The GSlib package contains the lib compiled for sozobonx c and
pure c, the sources, some examples, and the GEMSCRIPT specification
version 1.20 translated in english by Peter West.

You can get GSlib from my perso web site
http://perso.wanadoo.fr/arnaud.bercegeay/load_e.htm

Regards,

I just realized that it is not quite possible to compile it outside
XaAES. I'll make a separate entry on my homepage asap. That one will
be proper freestanding.

With the FreeMiNT/SpareMiNT patches, it should compile without much trouble.
GCC 3.0 works fine with the existing binutils, so you only need to recompile
gcc.

Hi,

how can a "reset" be done by software on an Atari?

I tried just to jump to the reset vector (address 4). It seems to work: the machine resets and is booting. But after this, I cannot get any data from the Midi Port! :-(

If I reset with the hardware button or with Ctrl+Alt+Delete, this works fine.

So I am looking for the "correct" way to do a reset.
How does the system makes the reset on Ctrl+Alt+Del?

Regards,
Mani

That's right. But the problem is that I do not have on my Hades 060, an

environment that allows me to compile GCC. I tried several times with GCC 2.95.3, without success. I didn't installed SpareMiNT. I use part of it, but never installed the whole package. If somebody would be so kind as to compile GCC 3.0, and release it on the WEB, it would be nice. I suspect that a few people are currently working on it. I would be interested by the result ...

Thanks for your advice,

CU,

Hi Manfred

>So I am looking for the "correct" way to do a reset.
>How does the system makes the reset on Ctrl+Alt+Del?

I wrote a utility to do that ages ago, i reset memvalid to 0's and some other vectors i dont recall at the moment and jumped to the reset vector, is memvalid is wrong a cold boot is executed, otherwise a warm boot is assumed. I could dig out my code if you want to use it for ideas.

I seem to recall that its not correct for a program to invoke a reset, especially if youre in a multi-tasking environment, data could be lost.

All I have is GFA code maybe this will help.

```
PROCEDURE kaltstart                    ! Coldboot
  '
  VOID GEMDOS(&H20,L:0)
  '
  SLPOKE &H420,0
```

```
  SLPOKE &H426,0
  SLPOKE &H43A,0
  '
  a%=LPEEK(&H4F2)+4
  a%=LPEEK(a%)
  '
  CALL a%
  '
RETURN

PROCEDURE warmstart                    ! Warmboot
  '
  VOID GEMDOS(&H20,L:0)
  '
  a%=LPEEK(&H4F2)+4
  a%=LPEEK(a%)
  '
  CALL a%
  '
RETURN
```

I always just to the address at 4.w it always works.

There is however some flags to set a soft or hard reset but I don't know
where they are.

>how can a "reset" be done by software on an Atari?

Here's some assembler that does the same as the above:

```
**********
*
* perform system reboot
*
* if d0 = 0     warm reboot
* else          cold reboot
*
* no return so no need to preserve registers
*
do_reset        move    d0,d7
        clr.l   -(sp)
        move    #$20,-(sp)
        trap    #1
        addq.l  #6,sp   ; not sure why I bother with this.
        tst     d7
        beq     reboot2

*
* clear memvalid flags so memory check performed
* wipes everything from memory, including any
* reset resident viruses
*
        clr.l   $420    ; memvalid 1
        clr.l   $43a    ; memvalid 2
        clr.l   $51a    ; memvalid 3
        clr.l   $42a    ; resvector
        clr.l   $426    ; resvalid

*
* get the reset vector mapped from ROM. This makes sure
* the TOS reset routine is called
*
reboot1 move.l  $4,a0
        bra.s   reboot

*
* get the reset vector from RAM. This allows soft-loaded
* OSes (Mint (?) and Magic) to direct the reset through
* their code
*
reboot2 move.l  $4f2,a0

*
* jump to the reset routine and carry on from there
*
reboot  jmp     (a0)

**********
```

As has already been mentioned elsewhere by Steve Sweet, this isn't a
good idea if you're using a multi-tasking system. This is especially bad
if there's any form of write-behind caching.

>I tried just to jump to the reset vector (address 4). It seems to work: the

Strange, as jumping to the address in $4 is the same as using the reset
button or Ctrl+Alt+Delete.

>So I am looking for the "correct" way to do a reset.
>How does the system makes the reset on Ctrl+Alt+Del?

It watched for the scan codes for those three keys being pressed coming
from the keyboard and, if the keyboard doesn't send a key released scan
code for one of the keys before all three are received, it jumps to the
reset routine.

Regards,
  David Bolt

off the top of my head

control Y - step into jsr/bsr too
control t - step but does not go into jsr/bsr
g - search
v - view screen
control L - load exe
b - load bin
s - save

They are the main ones. But I use Toxic Monst which is much more stable
when rasters are flying around :)

Grz

Is it a free program ? Where can I find it ? Does it work with MagiCMac ?

Anybody knows about a debugger working with MagiCMac ? Or at least MagiC ?

Ciao, ** *Mike* ** www.interware.it/users/mike/ mike@interware.it

Hi there,

How it is possible to change fonts without NVDI or any other programm?
Do I have to use Line-A? And what if I quit my app and my font should
still be available (an TSR app)?

That is usually a funcion of the application and/or the desktop. There
are programs that change fonts, but you sould still need NVDI or
something like it to load in and make available all the fonts you have.

Hello,

I would like to know whether anyone knows Holger Herzog who is the 'Project Maganer' of faceVALUE. His website (RUN!Software)
is still available but I can't get any answer of him by mail. That makes me a bit anxious... faceVALUE is now about v3.2 beta
and I'm a beta-tester... Does someone have news from Holger for me ?

Regards

Mathieu

He did not reply to my last mail either. You might mail Ingo
and ask him what is going.

There's nothing special going on, Holger is just a little busy at this time.
Please have patience or mail again.

Regards, Ulli

Hi all,

An history of shareware have been written by Europe Shareware,
from the beginning to nowadays. It relates the development and
the wide success of this unique spread mode of independent
authors softwares.

Read the history of shareware (in French):
http://www.europe-shareware.org/pages/hist_shareware.html

Best regards,
P. Ricard (ES)

Is that the version that I translated to English?

I certainly only did one version.

It has come to my attention while experimenting with loading/using my dialog object TLL, that there is a bug in the TLBX.H header file.

The error involves the function prototype for tlbxLibFlags function, and the sizes of the pararmeters to it.

The actual prototype should be

```
    uint32 _tlbxLibFlags( uint32, uint16, schar8 *, uint32 );
```

The #pragma and #define lines elsewhere in the header file, and the definition in the direct-call jumptable structure are correct, however.

This fault will manifest itself as being unable to alter the "bootload me" flag of an on-disc TLL file. Any program using thsi function (like the TLL_CONF CPX) should be recompiled.

A new, correct archive file containing the corrected header file and CPX will be placed on the webpage shortly.

When I see such types being used, I can imagine that the prototype was incorrect. :-)

I understand that such types are a way to ensure that the types are of the intended bitwidth. I suppose they are part of a sort of "compiler.h".

You must realize however that such types are of the 'black box' sort.
What you should have done is ahielding these again from the user by redefining them
once more, like this:

```
typedef uint32 tllong;
typedef uint15 tlshort:
typedef schar8 tlbyte;
```

etcetera

These type names belong exclusively to your toolbox suite and should be contained in the headerfile belonging to the suite.

You achieve that:
the bitwidth remains tight under control,
is of no concern to the user,
is not sensitive to lies, ;-)
and MOST IMPORTANT! is not part of the source proper.

And that is what high level languages are for.

What if you want to port your software to 64 bit systems?

Correct.

> I understand that such types are a way to ensure that the types are
of the
> intended bitwidth. I suppose they are part of a sort of
"compiler.h".

They are typedefs within the "0/types.h" file supplied with the
Toolbox.

When Toolbox development started (about early/mid July 1992). it was
written for my own use as a system-wide way of
loading/unloading/sharing plug-in modules among my programs. At the
time, I had int = 16 bits, and the typedefs reflected this (uint16,
sint16, uint32, sint32).

However, as "int" could also be seen as different bitsizes by some
compilers (Lattice, for example, which could be configured as either
16 or 32 bit ints), I changed my C code to include a separate file
which defined the sizes of the types.

The nicknames also helped me when I later changed over to int=32.

Assuming short=16, int=32, then I'd add

```
    typedef signed long int sint64;
    typedef unsigned long int uint64;
```

to my "0/types.h" file. This will however break when we move to
128-bit systems in the mid/late 2030's as we'll need some sort of
"extended long" type

(or should that be "long long int"? What have ANSI/ISO done about
"longer than long" types?)

(The Toolbox was written entirely in 68k assembly language, BTW)

I have a large box of Atari stuff free if you pick it up.

2 x Atari 800
1 x Atari 400
2 x 850 expanders
1 x 810 floppy drive
2 x Atari 1020 pen plotter/printers still in the box.
RAM cards, ROM cards, a few game carts (Qix, Defender,...),

miscellaneous boards, chips, etc,

I live in San Jose CA. Call quick if you're interested,
otherwise it all becomes landfill.

I'll call you tomorrow, I live in Rohnert Park and would love to come
get your old Atari stuff, I need a working 400!!

Thanks,

What is an "850 expander" ?

The number 850 is familiar as an old 8 bit peripheral, but I cannot
recall what it was.

It really depends on the GEM library you use. Popup menus are not a standard feature for TOS<4.x. The manual of your GEM lib should explain how to create them.

Greetings,

Hi programmers!

Hmm, is there away to set the unused (AFAIK) RTS pin on the midi 6850 ACIA? I need to write a tiny program that once run, turns this pin to a 1 state. I have Lattice C but it doesn't say how to do it so I guess asm is the only way. I looked at he memory registers but all I find is the base address in hexi this device. Actually basic should be able to do this well enough thinking about it.

Anyone know what each bit is for at the control address for midi ACIA?

Thankyou.

You can set and clear bits at specific addresses using C...*no* problem.

There are 4 registers using 2 addresses
2 are read only; received data & status
2 are write only; transmitted data & control

You can't read the control register so you'll need to keep track of it,
use a variable to store the control byte

Bits 6 & 5 control the RTS line

```
Bit  6    5    RTS  function
     0    0    low  transmit int.disabled
     0    1    low  transmit int.enabled
     1    0    high transmit int.disabled
     1    1    low  transmit int.enabled
```

Bits 4,3 & 2 set data bits,parity & stop bits

Bits 1 & 0 set the clock divider

the byte 00000011 is the master reset code

Not sure about bit 7, best to set to 0.

If your using BASIC just use POKE (ACIA address),control value

Hmm, I'm no genius but wouldn't poking a value (without peeking at what
is already there) muck up the parity/data bits information?
Would some apps ever turn this RTS pin to high state? This /is/ a concern
as it would be controling the PSU.

Thanks

The ACIA is not used for the RS232 port, it is used for the MIDI port
The address for the control register is FFFC04 and it is read only.
I don't see any way of insuring that the port isn't accessed by a particular program, I would assume those involved in audio would.
This is only a suggestion and I can't see how you would implement it.
You could use an interrupt driven routine to

i. constantly monitor the pin itself perhaps reading its state via the joystick port or cartidge
ii. if the pin goes low force a reset on the computer, this would at least indicate potential problem programs

I might be wrong but I think the ACIA data goes in on lines D8-D15Y

You could use pin 3 of the video port. This is the general purpose output. It is taken from I/O port A bit 6 of the sound chip. As far as I know you can read the registers on this. I'd have to check my trusty OSI Superboard literature ;-) (this system with a massive 8K BASIC, 2K monitor, AND whopping 8K of RAM) used the same sound chip)

Having re-read the above am I missing something. Is the line going to turn the PSU on or off. If the former you'll have a bit of a problem won't you?

I've gotten a prototype of my spell checking accesory up and running, but have gotten bogged down on the dictionary. I've been using a file I got from A.FASOLDT (I miss Genie!), but it includes a lot of things which don't belong (like abbreviations, acronyms, suffixes, prefixes and proper names). I'm pruning it by hand, but at this rate it may take a few weeks.

BTW, the final version will interface with other programs via
the cookie. If you have an editor and are interested, let me
know.

Hi

>Having re-read the above am I missing something. Is the line going to turn
>the PSU on or off. If the former you'll have a bit of a problem won't you?

It was an idea using an ATX PSU (my Falcon is towered) and a momentry
switch is used to start the PSU and then a wire (that is naturally 0)
would take over. Set this high and the PSU would go off.

I think I may just leave it actually, I just wanted it o be fancy! Unless
I use the extended joystick port, as there was a long tutorial about it in
AC.

Thanks anyway!

Hi, Lindon

Look into the Lacescan package. In that, you will find a couple of small programs (including source) for setting and resetting RTS of the keyboard ACIA. Just change the KBD ACIA address to that of the MIDI ACIA and all should be well.

Otherways, you can just poke the appropriate address and insert a proper value. I tried this from GfaBasic (to set/reset Lacescan) and it worked, of course- but it has to be done in supervisor mode. Basically, for KBD ACIA, you poke $D6 and $96 to set RTS on/off (or vice-versa?) into address $FFFC00. For MIDI ACIA it should be $FFFC04

>Anyone know what each bit is for at the control address for midi ACIA?

Look on Atari ftp sites for a file named, strangely enough, HARDWARE.ZIP. In that, there is a complete memory map for a range of Atari computers. Below is a segment that should interest you. Again, compare with Lacescan documentation:

```
-------+-----+-------------------------------------------------------+----------
##############6850 ACIA I/O Chips                                     ###########
-------+-----+-------------------------------------------------------+----------
$FFFC00|byte |Keyboard ACIA control             BIT 7 6 5 4 3 2 1 0|W
       |     |Rx Int enable (1 - enable) -----------' | | | | | | ||
       |     |Tx Interrupts                           | | | | | | ||
       |     |00 - RTS low, Tx int disable -----------+-+ | | | | ||
       |     |01 - RTS low, Tx int enable ------------+-+ | | | | ||
       |     |10 - RTS high, Tx int disable ----------+-+ | | | | ||
       |     |11 - RTS low, Tx int disable,           | | | | | | ||

Hi

>Look into the Lacescan package. In that, you will find a couple of small
>programs (including source) for setting and resetting RTS of the keyboard
>ACIA. Just change the KBD ACIA address to that of the MIDI ACIA and all
>should be well.

Clever boy :-) Thanks.

>Otherways, you can just poke the appropriate address and insert a proper
>value. I tried this from GfaBasic (to set/reset Lacescan) and it
>worked, of course- but it has to be done in supervisor mode. Basically,
>for KBD ACIA, you poke $D6 and $96 to set RTS on/off (or vice-versa?)
>into address $FFFC00. For MIDI ACIA it should be $FFFC04
>
>>Anyone know what each bit is for at the control address for midi ACIA?
>
>Look on Atari ftp sites for a file named, strangely enough, HARDWARE.ZIP. In
>that, there is a complete memory map for a range of Atari computers. Below is a
>segment that should interest you. Again, compare with Lacescan documentation:

Thanks, I was using the memory map from Mark Baines A to Z and it only
said the address. I had soo many pieces of text but I delted them all off
the ST when I moved it's HD to the Falcon. I had this file from funet I
think.

Thanks (I think the lacescan stuff was on AC cover disk back in issue 5 or
somewhere)

I think I might attempt this project actually.

Hello,

MagiC SDK

Europe Shareware is now able to offer a complete software development kit for MagiC to all the programmers. This package includes:

- either MagiC Atari or MagiC Mac or MagiC PC, with paper manual
- The GCC kit
- GCC Shell, registered version
- Ressource Master, registered version, with paper manual
- Windom libraries with its printed documentation (200 pages)
- EZ Edit text editor (with syntax "colourisation")
- Many development libraries
- Many development tools

All this for only 75.00 Euros !

This offer is for developers only. To have the advantage of this offer, you must tell us which MagiC compatible programme you have made in the past 24 months or which one you are going to produce in the next 12 months.

Have a look at the MagiC SDK page:
http://www.europe-shareware.org/atari/logiciels/magic_sdk.html

Bye,
P. Ricard (ES)

Actaully you should just be able to read the MIDI on an Atari by using
any Atari MIDI software. I have alot of MIDI files that I have gotten
of a PC program and they work fine on my Atari setup. The problem comes
when you try to use a MIDI Mac file. There is a program that I have
that takes off the header of the file and makes it so a PC/Atari can
read it.

Hi Andrew,

I forgot what the url is but try usine a search engine to find Mario Becrofts site. He has some hardware upgrades for ST's and one has an IDE host adapter so you might be able to use that to get the drive working on the ST. if you email to bestelec@concentric.net thats a place that sells replacement parts for the ST so you could probly find a new mouse from there.

problem.

There doesn't appear to be a _clean_ way of doing what you want to.(ie
read old hardware value, store it somehwere, modify the read value,
write it to the hardware, do something, restore hardware to saved
value) as the data read from the ACIA is in a different format to what
is written to the ACIA.

Unfortunately, setting or clearing bits within a memory address , when
using Lattice, often involves a Read/Modify/Write code sequence, where
the code generated by Lattice will fetch the old value, modify it, and
then write it. Given the value read from the register is in a
different format, and has a different meaning to what is written, you
cannot use a "modify bits within a byte" coding style
    ie: "a = (b & ~c) | d".is not feasible

So it looks like you'll have to simply reprogram the whole ACIA
register, instead of just the RTS portion of the ACIA register.

A sample app in C would look like this:

```
    #include <osbind.h>

    char value = ????;    // default value for ACIA register

    int set_midi_acia( void )
    {
        // write value to byte register at 0xFFC04 and return value
written
        return *(char *)0xFFFC04 = value;
    }

    int main( void )
    {
        value = whatever;    // value to configure ACIA
```

```
        Supexec( set_midi_acia );    // do the configuration

        do_something();    // do something

        value = whatever;    // set it to a default "safe" value
        Supexec( set_midi_acia );    // reconfigure the ACIA

        return 0;    // return success code
    }
```

I've recently had a phrase come to mind, and I cannot seem to recall where I first saw it.

The phrase is "OPTION BASE"

I seem to recall it being related to assembly language, but I cannot find it within the Devpac 3 manual, or within the Lattice C assembler docs.

Has anyone else come across this phrase? If so, where? And what does it mean?

Hello Martin!

  MD> On Linux the cross-gcc installs very fine - I did not
    > use it jet. I installed it yesterday, and installation
    > was a clean thing. Thanx, to the MiNT folks!

By a strange coincidence I was just looking at your GEMDOS site before wandering over here to ask about cross-compiling

software for TOS or MiNT.

I'll have to see whether cross-gcc is available for NetBSD,
although I could probably get the Linux version working with
a little effort (installing Linux compatibility). Would I
need any special libraries or other files to compile code
for TOS or MiNT on a (Linux or NetBSD) PC?

Regards,
  - Andy.

In GFA-Basic there is a command called OPTION BASE to set the starting
index of arrays. OPTION BASE 0 or OPTION BASE 1 so if you would
wish to you can exclude index 0.

Was that it?

It has to do with arrays. With option base 1 your arrays start with
element No 1. Option base 0 makes the elements start from No 0.

Hello!

> I'll have to see whether cross-gcc is available for NetBSD,
> although I could probably get the Linux version working with
> a little effort (installing Linux compatibility).

You can simply recompile it under NetBSD. I mainly use the crosscompiler
under NetBSD. The linux rpms I built for easy use by other people.

> Would I need any special libraries or other files to compile code
> for TOS or MiNT on a (Linux or NetBSD) PC?

You only need the libs you also need if you compile nativly. The rpms
contain the basic libs (libc, gemlib).

Tschuess
   ...Frank

My Toolbox DLL manager is now available for download.

Simply go to http://www.atari.net.nz/gem and follow the links from
there.

The archive contains the AUTO folder TSR, a user manual, programmer
manual, and an example client app which calls/loads a simple library
(both complete with C source code).

A library enumerator accessory, and library configuration CPX are also
included.

Hi all,

Resource Master price lowered:

From now on, RSM is published by our association. The most up to date
resourse editor is now priced at 22.50 Euros. You can make your
interfaces look nicier and make your work easier at low cost!

Have a look at the ES Resource Master page (in French):
http://www.europe-shareware.org/atari/logiciels/rsm.html

Best regards,
P. Ricard (ES)

> Which the difference between FF8264 and FF8265 in STe.

according to 'The Atari Compendium':

only the odd Byte of the Word $FF8264 is used for the 'Horizontal Scroll Register'

Best regards, Werner

(hoping to hear from your programs - Atari needs you!)

Can someone tell me how gfa-basic represents an 8 byte floating point value?

For example if I do:

```
f=22
open "o",#1,"test.dat"
bput #1,v:f,8
close #1
```

If I gave this file to someone who uses 'C' for example they need to know how gfa internal stores these in order to read back the value correctly.

Write 0.125, 0.25, 0.5, 1 and see what comes out.
It should not be difficult to see the pattern.

Try also their negations.

And of course their reciproques.

Does anybody know anything about the meaning of the falcon hardware
registers $FFFF8000/$ FFFF8001 and $FFFF8006.

The only thing I know is that the content tells something about the
memory installed. (TOS 4.04 uses this information to initialy clear
the memory)

Every documentation I found says something about the screen type
(TV, VGA, B/W,...).

Here what I know now:

```
$FFFF8600  7654xx1x
           ||||  |
           ||||  +---- Memory configuration Bit 0  (found by my self)
           |||+------- Memory configuration Bit 1  (found by my self)
           ||+-------- Memory configuration Bit 2  (found by my self)
           ||          These bits inform you how much memory is installed:
           ||             001  =  1 MB installed (= 512KB * 2^1)
           ||             011  =  4 MB installed (= 512KB * 2^3)
           ||             101  = 14 MB installed (= 512KB * 2^5 - 2 MB reserved)
           ||
           ||
           00          SM124 or compatible   (found in hardware docu from AURA)
           01          SC1435 or comp.       (found in hardware docu from AURA)
           10          VGA and SYNC monitor  (found in hardware docu from AURA)
           11          TV                    (found in hardware docu from AURA)
```

I hope somebody knows more about this stuff. I really need a complete hardware register documentation of my Falcon030.
(Perhaps some hardware developer knows more about it??)

Many thanks for your help!

Philipp

Hi,

Does anybody know if there is a newer version of AURAs hardware documentation than version 0.4 from 11 march 1993??
Or is there something equivalent available?

Best wishes
Philipp

Everywhere was written, $ffff8006 shows the type of connected monitor.
But Thomas Binder once found a way to extract the correct
Falcon-RAM-size from that adress!

I found this old Assembler-Listing: (c) Thomas Binder / ST-Computer 11/1993

```
          move.w    $ffff8006,d0
          lsr.w     #8,d0
          lsr.b     #1,d0
          move.b    d0,d1
          andi.b    #1,d1
          lsr.b     #2,d0
          andi.b    #6,d0
          or.b      d0,d1
          move.l    #$80000,d0
          asl.l     d1,d0
          cmpi.b    #5,d1
          bne.s     no16mb
          move.l    #$e00000,d0
no16mb:   rts
```

In 'd0' you can find the Byte-size of the RAM

You can also find this routine for GFA-Basic at 'Download -> PeaSoft
Download -> GFA Basic Bibliothek' on my WebSite (see below)

cheers, Werner

Anybody know some technique to make INFINITE hardware scroll with STE/FALCON
machines.

Vertical and horizontal without Blitter please.

I've been going over my Toolbox DLL manager (available from my web page [http://www.atari.net.nz/gem/tlbx] and I'm currently wondering what features I should add/modify.

At present, I'm thinking of adding some form of "call logging" so a programmer can look at the last few calls to the Toolbox or its dynamically loaded libraries, and detect what happened while their program uses the Toolbox.

Are there any other features I should be thinking of adding?

Hi,

> I found this old Assembler-Listing: (c) Thomas Binder / ST-Computer 11/1993
(c) ????
I don't think it's from Thomas Binder as I found the same routine in my
TOS 4.04
(disassembled).

```
>           move.w    $ffff8006,d0
>           lsr.w     #8,d0
>           lsr.b     #1,d0
>           move.b    d0,d1
>           andi.b    #1,d1
>           lsr.b     #2,d0
>           andi.b    #6,d0
>           or.b      d0,d1
>           move.l    #$80000,d0
>           asl.l     d1,d0
>           cmpi.b    #5,d1
>           bne.s     no16mb
>           move.l    #$e00000,d0
> no16mb:   rts
```

But this doesn't say anything about the other 5 bits of $FFFF8006...
So my problem isn't solved...

Philipp

It's from GameFix's source, but it's just a copy from TOS ROM - and IIRC
clearly marked as such, though I'm not absolutely sure (must look that
up).

Ciao

Thomas

>           ||+-------- Memory configuration Bit 2  (found by my self)
```

According to the Atari compendium this register address range 0x00FF8600 - 0x00FF8602 is a word address and is 'reserved' (no shit) and is listed under "ACSI DMA and Floppy Disk controller"

What's your programming language?
Assembler ? C? Basic?

What you need are the right hardware registers...

What do you meen with "infinite??"
Scroll down.... and at the end of the screen just flip back to
the start??

a+
Philipp

If there is pattern there I'm not getting it. ;-)
I was hoping someone could say it's uses some known format.

I'm not so good at guessing about this.
Thanks for the suggestion though.

The Compendium also says nothing more than that.
But: Do these 5 Bits have to have a meaning? What kind of infomation are you hopeing to extract else out of this Byte?

Curious, Werner

You can either use the hardware scroll but it is very memory hungry.
Horizontal is easy, vertical is simple uses even more memory.
In horizontal mode you specify the width of the screen then the offset in
words and pixels.

For vertical scrolling you can cheat by making the screen wrap around and
updating a small area just below or above the visible screen.

It would probably not me worth it unless a newer card is used (as you mention).

> The Galaxy uses a (reasonably large) FPGA (Field Programmable Gate Array),
> so it could certainly be made to do 3D if someone put their mind to it.
> To my knowledge, there's nothing like that now, though.

Again this looks like hardwork, unless someone really wnats to do this then I think the effort would be better spend on another project.

> >With the original problem in mind, could there not be some kind of

> >H x D (maybe pages) that were passed, with an error returned if the computer
> >was not capable?
>
> Certainly. It's easy enough to do in the fVDI/RageII driver.

I would like to see this, there should be no reason why simple games could

not be developed and run nicely on a number of systems. As mentioned,
blitting abilities would be nice.

> 99% or so of the DirectX functionality would in any case be completely
> out of the question for performance and effort reasons.

I thought that 99% of Direct X was pointless loops or NOPs, I imagine so
they can remove a few and make it a bit quicker on the next release.

Seriously, the major functions like paging, blitting, sprites, fonts, music
(I know that's not you), etc would be nice. The chap that made the Doom
ports wanted to start some kind of project along these lines.

Mark.

I don't think so, if it is a useful app which you want to release in the future you do not want this coming back to haunt you.

As I understand you only need to open one file at a time, make the changes, write it back (is this right?), so you should be able to reduce the limitations by saying "the single biggest file" rather than "the sum of the file sizes" which should greatly improve usability of the app.

Better still, if the editing procedure permits it you could read chunks of data in at a time (64K or so) and then save it as you go, your program would then be reduced to using a static (say) 180K of RAM rather than 140K to 140Mb.

If only two files need to be opened at once I would seriously consider changing you loop procedure.

I may be way off but I hope this helps.

Mark.

Hi all,

ACSpro (http://acspro.atari.org) stands for "Application
Construction Set professional".

It's a, visual, user-friendly, application construction
set, coming from Germany (English version is available). It
works on all Atari systems, including clones and emulators.
Supported languages are GCC, Pure C, Lattice C, Turbo C and
Pure Pascal. Lots of examples are supplied as well as
libraries for Pure C and Pure Pascal.

It's now possible to register your copy via
Europe Shareware (http://www.europe-shareware.org).

Bye,
P. Ricard (ES)

I'm trying to send Ping messages with STinG using GFA Basic.

Starting from the STIK_GFA library by Lonny Pursell so far it seems to
work well with STinG as well. I had to delete some STiK specific
"declarations" but apart from that it seems quite usable.

Now I'm trying to port the ICMP_SEND part (quoting the STinG .HYP):

```
----------
    int16  cdecl  ICMP_send (uint32 dest_host, uint8 type, uint8 code,
                             void *data, uint16 length);

Function :
   Send off ICMP datagrams.

This function sends an ICMP message. `dest_host' is the IP address of the
destination machine, `type' is the ICMP packet type. `code' is a type de-
pendent control code for ICMP. `data' is a pointer to data which is to be
send after the ICMP header, `length' is the length of the data block in
bytes.
----------
```

by writing:

```
FUNCTION icmp_send(rhost.%,type.&,code.&,buf.%,len.&)
  type.&=OR(SHL&(type.&,8),code.&)
  RETURN C:icmp_send_%(L:rhost.%,W:type.&,L:buf.%,W:len.&)
```

ENDFUNC

What about the second line. Should it perhaps be written the other way around like:

type.&=OR(SHL&(code.&,8),type.&)

to get the two byte parameters right on the stack?

Next step will be how to implement the ICMP listening part. The STinG doc's talks about "callbacks". Does this mean (to GFA) that I have to provide an address to an INLINE code part and then read the resulting queue from Basic?

I'm glad you found my gfa devkit useful.

```
>     int16  cdecl  ICMP_send (uint32 dest_host, uint8 type, uint8 code,
>                              void *data, uint16 length);
```

I assume uint8 is an unsinged 8bit value. "C" is not my strong point.

```
> Function :

> ENDFUNC
```

This would be my guess. If you had some way to test it that might shed some light on it. I see your problem, GFA can't pass a byte directly with the C:() function.

> Next step will be how to implement the ICMP listening part. The STinG doc's talks about "callbacks". Does this mean (to GFA) that I have to provide an address to an INLINE code part and then read the resulting queue from Basic?

I'm not sure what you mean by callbacks. If you are refering to some way to make external calls to GFA code from some outside source, then you have a problem. There is only one way I know of to do this and you can find it in my GFA archives on my web site, called EXTCALL.LZH. However it has limited use and requires some polling method, you might also need to know assembler to adjust the routine to you needs.

I'm confused why you use $m to keep such a large memory area for gfa's internal string/memory area, and then malloc() another block from the system nearly identical in size. I don't know how much ram you have, but the malloc() "gamdos72" call might be failing?

You really should test this value to see if the malloc() is ok:

```
IF mem_addr%<=0
  PRINT "malloc() error!"
  END
ENDIF
```

The rest of code is not too helpful since it is incomplete. Some small bit you think is not worthy of posting could be where the problem is. ;-)

From what I can tell you are simply processing many files, rather small ones at that. Something really strange is going on if you run out of ram. I'm not sure what it is after looking at your code.

You're right - I want to process hundreds of files about 4000 bytes each. The procedure is to use FSFIRST/FSNEXT to read a directory, get the name and size of the file from the DTA, OPEN that file to read, OPEN a new file to write to, trim off about 6 bytes from the original file and and save this data in the new file, then CLOSE both files.

If I allocate (say) 100,000 bytes with $m100000, the program will quit after about 70 or 80 files.

My workaround solution is to grab all available memory with $m40000000 and then calculate the actual amount of ram available to advise the user how many files he can process. I know that's redundant, but it doesn't cause problems.

What I would ideally like to do is to use the SAME memory block for each OPEN / CLOSE cycle. But if I insert ~FRE(0) anywhere in the program it exits immediately as though it has come to the last file in

the directory.

I suspect I need to assign a memory block of about 5000 bytes to read
the file data into, but I don't know how to do that.

I have been teaching myself programming in assembler using my STE 1040 and
Devpac3. I would like to get into GEM programming and have started with some
basic stuff but would like to get hold of a copy of the Resource
Construction Set. Any help appreciated.

Thanks

Ric

If you know the maximum memory you need, why not use INLINE to allocate
it and then use BGET/BPUT, or even BLOAD/BSAVE, to load and save the
files.

EG:

```
PROCEDURE process.files(input.name$,output.name$)
  ' use a 6k buffer
  INLINE our_buffer%,6144
  '
  OPEN "I",#81,input.name$
  OPEN "O",#82,output.name$
  the.size%=LOF(#81)
  '
  ' Read the file into the buffer, upto a maximum of 6k
  '
  BGET #81,our_buffer%,MIN(6144,the.size%)
  '
  ' Write out the buffer, skipping the required 6 bytes
  ' this assumes the first 6 bytes are supposed to be skipped
  '
  BPUT #82,our_biffer%+6,MIN(6144,the.size%)-6
  '
  ' Check if the file is bigger than 6k, and copy the rest if it is.
  '
  SUB the.size%,MIN(6144,the.size%)
  WHILE the.size%
    BGET #81,our_buffer%,MIN(6144,the.size%)
    BPUT #82,our_biffer%,MIN(6144,the.size%)
    SUB the.size%,6144
  WEND
  CLOSE #82
  CLOSE #81
RETURN
```

Regards,
  David Bolt

Thanks for replying Lonny Purcell! (My newsserver has been down so I had
to catch your reply from Google). Your code has been of great help.
Worked almost without any changes. Unfortunately my code will not work
with STiK _or_ STiK2 as the interfaces works differently.

>I'm trying to send Ping messages with STinG using GFA Basic.

"original" C code:

```
>int16  cdecl  ICMP_send (uint32 dest_host, uint8 type, uint8 code,
>void *data, uint16 length);
```

```
>FUNCTION icmp_send(rhost.%,type.&,code.&,buf.%,len.&)
>type.&=OR(SHL&(type.&,8),code.&)
>RETURN C:icmp_send_%(L:rhost.%,W:type.&,L:buf.%,W:len.&)
```

```
>ENDFUNC
```

The above code did not work, but provided with a bus error from STinG.
After som experiments I came up with:

```
FUNCTION icmp_send(rhost.%,type.&,code.&,buf.%,len.&)
  $F%
  type.&=SHL(type.&,8)
  code.&=SHL(code.&,8)
  RETURN C:icmp_send_%(L:rhost.%,W:type.&,W:code.&,L:buf.%,W:len.&)
ENDFUNC
```

that does work! Perhaps a bit surprisingly I had to shift left 8 bits and then feed the stack with words. Anyway Logsting (a development tool for STinG) showed up with:

```
Call to 'ICMP_send' ($444c353).
   Remote_Host            (IP)  :  192.168.0.2
   ICMP_Type           (uint8)  :  8 ($8)
   ICMP_Code           (uint8)  :  0 ($0)
   Buffer_Address     (uint32)  :  3731794 ($38f152)
   Buffer_Length      (uint16)  :  32 ($20)
     $0000 :  20 20 20 20 20 20 20 20 20 20 20 20 20 20 20 20 '
     $0010 :  20 20 20 20 20 20 20 20 20 20 20 20 20 20 20 20 '
   returns             (int16)  :  0
```

and ZoneAlarm on my pc popped up with a warning about "Ping" from 19.168.0.194 so everything seems OK now.

My next attempt will be to recieve the answer. The "callback" from STinG should mean that I first provide the STinG kernel with an address within my program with code to act on the call. When an "Echo reply" packet arrives STinG jumps to the address and my code gets runned.

This has to be a short INLINE assembler routine that somehow buffer the incoming data so the GFA program can fetch it later on. I have not yet figured out the data structures in detail but eventually i will...

I don't think beyond the original stik devkit I was too helpful.
I've switched to mintnet some time ago and not used sting calls
at all, or stik2 calls either. ;-)

The EXTCALL does something similiar, it lets you pass out the address
of the inline to some other app. The app can then call this routine
and pass parameters which are stored. I don't know if this will work for
you purpose. Unless you code your own method, this EXTCALL is the
only one I know of that works with GFA.

Would be as simple as:

```
' load file to be converted
OPEN "I",#1,in$
fl%=LOF(#1)
ba%=MALLOC(fl%)
IF ba%<=0
  ' error has occured
ELSE
  BGET #1,ba%,fl%
```

```
ENDIF
CLOSE #1
' code to convert file would be here
OPEN "O",#2,out$
BPUT #2,ba%,fl%-6 !trim off the end
' BPUT #2,ba%+6,fl%-6 !trim of the beginning
CLOSE #2
~MFREE(ba%)
```

This will do alot of allocation/deallocation cycles. But I show you this so you can see how easy it is. A better way would be to know the largest file you intend to load, and MALLOC() the buffer just once and reuse it, then free it when the program is to end.

You could use inline also, as long as the buffer is under 32k and you don't care how large the binary gets when you compile it.

The ~fre(0) is only useful if you are doing massive string manipulations, I'm still baffled why it halts your program, but it may be related to your memory problems.

Go to the following WEB page and download the K-Resource editor...it is a
replacement for the Resource construction Set:

<http://groups.yahoo.com/group/atari-midi/files/Programming/>

Yes, this EXTCALL routines works pretty much the same (some work saved again!). I have to elaborate the idea somewhat with internal checking if the recieved packet originated from me etc. I also must send a ICMP_discard message back to STinG within this INLINE routine.

I'm writing a GEM program and the idea of "piping" messages from the routine seems appealing. Makes me wonder if it's possible to do an APPL_WRITE call to GEM when in supervisor mode during an interupt?

What I'm writing? A connection monitoring program to be runned on my online TT. Sometimes my ADSL line goes down and it would be nice to get a warning when that happens. Could also be fun to monitor some other servers and get graphs etc on screen. But, first I have to get this Pings to work...

I do not know, perhaps someone else can step in and answer this
one? ;-)

I just released a program and Pure C/Assembler source code to
create & use RSA encrypted key files for shareware. The idea
is that while hackers can easily find the public key,
they would need the private key to create fake key files.

I was just about to release the new version of ELFBACK when I
discovered a very annoying result. Both the ST and TT versions
of the program work fine, but they produce incompatible backups!

About the only difference between the versions has to do with
calculations of the form A*B/C using unsigned longs.
On the TT I use 64 bit multiplies and divides, but on the ST I
have to use

A*B/C = (A/C)*B + (A%C)*(B/C) + (A%C)*(B%C)/C

The only other differences have to do with compiler options.
Very annoying!

As far as i know from 80s, there was a bug in the floating-routines from the OS or basic. I have tried ? SQR(4), but result 2 was o.k.. Does anyone know an example, where one can reproduce a 1.99999 instead of (or something like that) ?

Best regards in advance

There was just one program the people in Europe never could buy, it was the Atari Calculator (C) 1979.

Has anyone a manual of that program? Or does anyone know how to extract the commands via an editor or something like that? Or has anyone a textfile or htmlfile of the commands?

I would be wishless lucky, if one can help me.

The very best regards

The OS does not contain any floating-point code (I should know, I have the
source ;-)).

The old ST basic was quite buggy not only in regards of floating-point -
that was why noone is using it anymore, since better alternatives exist -
GFA-Basic, PureC and other development systems have working float support.

Thank you Lonny and David for your advice on how to use the memory...

Things are now working a lot better but I still have a problem that is
driving my buggy....

I give a choice at the opening - one choice will trim the file down
and the other choice will add 8 bytes to the file (6 at the beginning
and 2 at the end.)

The section that trims the file works beautifully - I can use ~FRE(0)
and I don't run out of memory. I use:

```
BPUT #2,work_buffer%,4096
```

The section that adds bytes processes two files before exiting - if I
use ~FRE(0). If I don't use ~FRE(0) all the files will be processed
(in the interpreter), but the compiled program will run out of memory
and only process a few files (unless I allocate a lot of memory using
$m1000000).

The section goes like this:

```
OUT #2,&HF0,&H43,&H0,&H9,&H20,&H0
BPUT #2,work_buffer%,4096
OUT #2,&H29,&HF7
```

Why is this causing a problem with ~FRE(0)? Everything else in the
program is identical.

Which is (was) a pity, isn't it? I think that many things could have been
much simpler and faster had TOS author(s) made a library of floating-point
operations and functions a part of the OS. It could have made the best of
various configurations of CPUs and FPUs and take just a little ROM space...

That's what I'll do - but it's very frustrating to have this
unbeatable glitch in my code.

Lonny if you're interested, I could send you the complete code along
with a few sample files - I'm reluctant to post them to the newsgroup

simply because of the size - I'm not worried about any "secret" code
being released to the world.

Uhm. Considering the normal quality of the TOS code, I'd say the answer
to that question is a resounding NO. ;-)

>much simpler and faster had TOS author(s) made a library of floating-point

Not many things use floating point in the first place (well, at least
not many _need_ floating point), and since most people don't write in
assembly, it doesn't matter where the float code is.
It definitely wouldn't have been faster to have something locked into ROM.

>operations and functions a part of the OS. It could have made the best of
>various configurations of CPUs and FPUs and take just a little ROM space...

You can't make good use of an FPU via a library.
The calling overhead is a major hit even on an '030. With an '040/'060
it would swamp the actual execution time of common operations.

I've been playing around with a concept you might find useful.
It's a way to implement a multi-threaded GEM interface using
independent threads for each window, plus one for the menu bar.

Each thread uses a diffent stack and, except for global variables
and a common application id, each thread functions as a separate
program under cooperative multi-tasking. The interface can even handle
multiple timer events with different delays.

I put a demonstration program into my FTP library (DEMO.ZIP) and
a slightly longer explaination under my Projects page.

Whatever, even now, a coprocessor-emulator for TOS based machine would
be cool woudn't it ? And not that hard to write if you consider you just
have to
install your code in line-f ! :)

Thank you Lonny for the changes. All is working well now.

There was another little glitch in the file renaming code. If the file name had less than 8 characters before the extension (SPACE1A.TX7) the new file would be written as SPACE1~1.SY instead of SPACE1A.SYX.

The original code was :

```
    OPEN "o", #2,LEFT$(filename$,8)+".SYX"
```

I changed it to:

```
    x=INSTR(filename$,".")
    OPEN "o", #2,LEFT$(filename$,x-1)+".SYX"
```

Thanks again for all your help.

BTW I'm using GFA 3.5e

Yes, theoretically it would be cool. And it even exists- Henk Robbers
made it a long time ago and I have the program installed on my computer
(in fact it emulates a line-F coprocessor through a memory-mapped one).
Unfortunately I have yet to come upon an application which uses it-
because sowtware authors are inclined to think that if you have a
coprocessor you must also have a 68020 or better, so they always seem to
compile a coprocessor version, if any, as 32-bit code- which need not
be so.

A nice touch :) I must agree with this.

>Not many things use floating point in the first place (well, at least
>not many _need_ floating point), and since most people don't write in
>assembly, it doesn't matter where the float code is.

>It definitely wouldn't have been faster to have something locked into ROM.

My idea was that it would have made fp operations performed in a unified
way, taking automatically into account a FPU if it exists (so that
separate FPU versions need not be compiled), and it would also take away
different implementations of floating point numbers (IIRC GfaBasic uses
some weird format for floats). I suppose also that it would not be hard to
find examples of badly-coded floating-point functions created by some
compilers, or linked from this library or that, as everybody reinvents
the wheel again- which would be avoided assuming a well-optimized OS library.

As for speed- I admit I was biased by a machine I have- a MC68000 MegaST.
On a MC68000 Atari ROM access could be, quite easily, made to be faster than
RAM access (running CPU on 16MHz for internal ops AND ROM access), but on
any other Atari it was not so.

>You can't make good use of an FPU via a library.
>The calling overhead is a major hit even on an '030. With an '040/'060
>it would swamp the actual execution time of common operations.

I would agree that it might be so for basic arithmetic. What about, say,
trigonometric functions, etc. Do you mean that calling a library for
basic fp arithmetics would kill any advantage in computing more
complex functions?

Hello, Coders!

After clearing up the license status of Digital Researchs GEMDOS, I can now provide most parts of GEMDOS under GPL license. They have been available for a longer time on the GEM World site, but the copyright status had been unclear. This now changed (as you can read on my site).

You now can get a GEMDOS porting kit with all, but the machine specific parts of GEMDOS in source form. Maybe, it is just for historicle interest, maybe you can use it for something new. So, now have a look at:

http://www.mucl.de/~mdoering/atari/en/index.htm

At last many thanks to Lineo - they made this possible!

Martin Doering

Hi!
I am looking for a cross compilation developping solution. I want to build a .prg atari st compatible executable using a ms windows command line C++ compiler (like Gnu distribution ...). When I develop a console game ie PlayStation, Nintendo64, ...) I can build my executable on a PC and finaly send it to my hardware target..
Do you know any similar solution to build a atari ST executable (runnable under classic TOS system)?

Best regards,

David ALLOZA. (aka oxythan from WEG :))

For RedHat and Suse Linux there are ready to install cross compiler
packages (http://wh58-508.st.uni-magdeburg.de/sparemint/cross-mint.html).

With cygwin I'm sure you can compile the cross gcc under Windows too.

Cygwin is a Unix environment for windows.
Look at http://sources.redhat.com/cygwin/ for more informations about
cygwin. Then just get the binutils/gcc and the FreeMiNT patches and build
the crosscompiler :-)

Tschuess
   ...Frank

On Linux the cross-gcc installs very fine - I did not use it jet. I
installed it yesterday, and installation was a clean thing. Thanx, to
the MiNT folks!

>
>My idea was that it would have made fp operations performed in a unified
>way, taking automatically into account a FPU if it exists (so that

To be compatible with machines without FPUs, the calling interface to
any such functions would have to pass the float variables in the integer
register or on the stack (or similar). Needless to say, that would cause
tremendous overhead for machines that do have FPUs.

>separate FPU versions need not be compiled), and it would also take away

For the few programs that actually benefit from FPUs, I don't think
building two (or more) versions is a major problem.

>different implementations of floating point numbers (IIRC GfaBasic uses
>some weird format for floats). I suppose also that it would not be hard to

Well, full IEEE754 compatibility is a vast overkill for most applications,
but necessary in other.

>find examples of badly-coded floating-point functions created by some
>compilers, or linked from this library or that, as everybody reinvents
>the wheel again- which would be avoided assuming a well-optimized OS library.

If everyone used gcc (which supports lots of languages), that would not
be a problem. ;-)

>>You can't make good use of an FPU via a library.
>>The calling overhead is a major hit even on an '030. With an '040/'060
>>it would swamp the actual execution time of common operations.
>
>I would agree that it might be so for basic arithmetic. What about, say,

And the basic arithmetic functions implemented in hardware in the '040 and

'060 cover the vast majority of floating point operations.

>trigonometric functions, etc. Do you mean that calling a library for

Only the '881/'882 support those functions in hardware, anyway. The '040
and '060 needs partial FPU emulators or libraries in any case (a library
could be significantly faster).

>basic fp arithmetics would kill any advantage in computing more
>complex functions?

Naturally, in most cases, since the complex functions are far less
commonly used.

Doing function calls for addition and multiplication on a modern
processor could easily bring your throughput down from one result per
cycle (I don't think even the '060 manages that, though) to (possibly
significantly) over a dozen cycles per result.
(Apart from the obvious extra time needed for parameter passing and
 function calls, you can't make use of the pipelining in the FPU, since
 every result needs to be complete before you can move it to the stack
 or integer registers.)

Hi
  I have just been given a Atari 520ST, I have no manuals,
software or mouse! Have found that alt and cursors move mouse
pointer ok. Can any one point me to connector pin out info

(have found the composite video, by using a scope) and
software sites.

I have no real use for this machine, apart from an interesting
project! What would be the chances of connecting the atari to an
old 40meg ide hard drive (very little I suspect!)

Regards

Andy

Sure you *can* connect the 520ST to a 40meg IDE hard drive...there
are directions *somewhere* on the 'net. But I would suggest you
start with the Atari ST Quick FAQ at:

<http://www.megacom.net/~q-funk/ST/>

I would appreciate advice on how to create pop up menus. I have a RSC and
can generate dialogue boxes with most features but I don't know how to
generate or manipulate the pop up menus.

Hi !

I know everything about faceVALUE. And I know its (second) author/manager : Holger HERZOG.
faceVALUE is now about version 3.2 (beta) and 3.0 (official). It is the greatest GFA development
tool I've ever seen. I use it everytime. If someone is interested in the DEMO-Program of faceVALUE,
just ask me. It demonstrates 90% of his capability.

Mathieu

Before you start, you need to disable both the tone and noise
generators for all three channels (in supervisor mode).

```
move.l #$0700FF00,$ffff8800   ;load $FF into register 7

>sample_rout:
<snip>
>  move.l   (a0)+,$ffff8800.w ; copy bytes to soundchip
>  move.l   (a0)+,$ffff8800.w ; copy bytes to soundchip
>  move.l   (a0)+,$ffff8800.w ; copy bytes to soundchip

<snip>

>; Converted file for TASM: was IBYTES "..." from
>; file <C:\MOD\TRACKERS\PROPLAY.11B\QUARFAST.TAB>
>sample_table:
> DC.B $08, $00, $09, $00, $0A, $00, $00, $00
<snip>
```

This should be

```
DC.W $0800, $0000, $0900, $0000, $0A00, $0000
```

through

```
DC.W $0800, $0700, $0900, $0700, $0A00, $0700
```

to load 0 through 7 into registers 8, 9 and 10. You could save
RAM by only storing the amplitude values in the table.

The d/a converter in the sound chip is deliberately nonlinear,
hense the table. It also only outputs positive voltages, with
RC coupling to the amplifier to remove the DC bias.

Is it only available in German language these days? I really would love
to get an update as this tool is _extremly_ useful if you want to write

modern GEM programs fast and easy.

I have written some GEM programs in standard GFA, but with FaceValue you hardly need to care about how the user interface works at all. It's all taken care of automatically. And as there is no speed penalty it's fully usable on a 8 MHz ST as well. The executables tend to grow a little but compared to pc Visual BASIC they are still almost non existant :-)

printf() will end up making OS calls. If at any stage during your "printf interrupt" the OS finds itself in non reentrant code then you are up the preverbial creek paddle-less!

For what it is worth, the only calls that can be made from VBL without too much bother are LineA ones. In fact if memory serves, you can stuff C object code into a VBL slot if it's compiled right.

Mind you, this is a moot point. Your monolithik multitasking system is going to be reentrant isn't it? ;-))

```
>are there any examples for how to call user defined C-functions from
>interrupts ?
```

I did have some code for a custom VBL (linea driven) mouse. That, like a lot of stuff has gone. This one section remains...

```
#define  DEF_VARS
#include <sysvars.h>
#include <cpu.h>
#include "misc.h"

bool
_mi_vbl_slot(newvbl,install)
void (*newvbl)();
bool install;
/*[  bool _mi_vbl_slot(newvbl,install)
     void (*newvbl)();
     bool install;

 Installs or removes a handler from the VBL queue. 'install' should be
true
 to install the user handler 'newvbl' which will be installed in the
first
 free slot located. true will be returned for success and false for
failure.

 When 'install' is false then 'newvbl' is searched for in the VBL
queue and
 removed if it located, returning true for success and false for
```

failure.

 The routine saves the VBL semaphore and then disables VBL processing while it
 searches and restores the original state before returning. The current
 processor state is saved and supervisor state obtained if neccessary, the
 previous state being re-instated before returning.

 False denotes a full VBL queue for installation and that the handler has
 already been removed for removal.
]*/
```
{UWORD   old_vblsem;
 bool    old_state=cp_procstate();
 int i;
 ptr *addr         =(install ? NULL : newvbl);

 if (!old_state)   cp_superstate();
 old_vblsem = *SYS_VBLSEM;
 for (
     i = 0;
     i < *SYS_NVBLS;
     i += 1
     )    {

     if ((*SYS_VBLQUEUE)[i] == (ulong)addr)    {
          if (install)  (*SYS_VBLQUEUE)[i] = (ulong)newvbl;
          else     (*SYS_VBLQUEUE)[i] = (ulong)NULL;

          *SYS_VBLSEM = old_vblsem;
          if (!old_state)    cp_userstate();
          return true;
     }
 }

 *SYS_VBLSEM = old_vblsem;
 if (!old_state)   cp_userstate();
 return false;
}
```

...have to cut it short. Been awake far too long!

==========
Some more code as used by the _mi_vbl_slot() function...

```
//cp_procstate()...
#include <osbind.h>
#define  DEF_CPU_COMPILE
#include "cpu.h"

bool
```

```
_cp_stat()
/*[  bool _cp_stat()

 returns true if processor is in supervisor state and false if it is
not. It
 does this by issuing Super(1L).

 Note cp_????() functions expect the following:

 Processor is initially in user state unless otherwise documented.
 Processor state is only altered through cp_????() calls.
 User / Super stacks changed only by cp_????() calls.
 _cp_stk() is not accessed by uninformed user code.
 GEMDOS Super() remains as documented.
]*/
{
 return (Super(1L)) ? (true) : (false);
}

//cp_superstate()...
#include <osbind.h>
#define  DEF_CPU_COMPILE
#include "cpu.h"

void
_cp_sup()
/*[  void _cp_sup()

 _cp_sup() tests (through _cp_stat()) to ascertain the current
processor state
 and if that state is user then it issues a GEMDOS Super(0L) followed
by a
 _cp_stk(,true) to save the old super stack. Where the processor is
already in
 super state then no action is performed. After a successful state
shift then
 the new supervisor stack is set equal to the user stack valid on
entry.
]*/
{
 if (!_cp_stat())  _cp_stk(Super(0L),true);
}

//cp_userstate()...
#include <osbind.h>
#define  DEF_CPU_COMPILE
#include "cpu.h"

void
_cp_usr()
/*[  void _cp_usr()

 _cp_usr() first tests the processor state (through _cp_stat()) and if
```

```
that
 state is supervisor then it obtains the saved super stack from
_cp_stk(,false)
 and issues GEMDOS Super() with that value. This has the effect of
setting the
 supervisor stack back to its old value, freeing the user stack from
system use
 and placing the processor back into user state. Where the processor
state is
 already user state then no action is performed.

 It is very possible to mess the system up if you mix GEMDOS Super()
calls with
 cp_????() calls.

If it's NULL do nothing, otherwise interrogate it. You should arrange
for your program do run after magxboot & in that fashion I see no
reason why it shouldn't work. There's a tad more info in a previous
thread in this group entitled "Checking MiNT/MagiC version".

The ICD Multi I/O board (MIO) is a complex peripheral device which adds exceptional power to the Atari 800XL or 130XE computer. The MIO gives the user five additional hardware functions not available with a stock 8-bit Atari computer. These are: a parallel printer interface, a serial interface for printer or MODEM, a printer buffer, a bootable RAMDISK, and an SCSI/SASI interface for hard disk drives. An optional sixth function (80 column board) may be added at a later date. This 256k MIO was used to run an ATARI BBS quite a number of years ago and was working fine when it was stored, It includes the MIO base unit,Instruction manual, software,SCSI hard drive Seagate 1096N and SCSI cable. I couldn't find the power supply adapter. This needs an adapter to use on the 130XE. SHIPPING IN USA ONLY. Payment must be received within 7 days of auctions ending. Shipping charge USPS MAIL $10.00. PS:The ICD/FTe Multi I/O (MIO), all versions, can use both AC and DC supplies. But stick to voltages of at least 6.2-7.2 V. **AUCTION ENDS**

The program is still in English language but the documentation is in German.
There are still the example programs which show every feature of faceValue.

Greetings,
Matthias

Hi all,

I'm trying to change the resolution in Falcon using Setscreen and all
the staff :-)
I think it works... but :-/
Do I have to 'update' VDI after that (change somewhere resolution and
colors)?
If not, then why do I have problems using VDI functions (vro_cpyfm for
example)?

And the second question.
Will it work on Milan too? if not, then how should I change the
resolution on Milan? (I have only F030).

Falcon I cannot say.

> And the second question.

If Milan is anything like the Hades clone, changing the resolution
under program control is a really bad idea if at all possible. Someone
with a Milan might be able to be more specific. It would make more sense
to have the program adjust itself to the current resolution, thus
making your prg run on much more hardware, and future clones.

Hello.

I 've read on "The Atari Compendium" and other documents that physical screenaddress must be aligned in boundary.
What is that mean?? or where can i find a document that explains this question?

Also i read that this boundary chages depending the model, 256 for ST and a word boundary for TT. But what about the Falcon??.

D Galvez

If you change resolution, you're on your own.
There's no way the VDI can know what resolution you have set without
you telling it, and there's no official way of doing that.

With the standard VDI, it might be possible to get it to work by
modifying a bunch of LineA variables, since it makes use of those.
It's even possible that such an approach would work with NVDI.

You are not supposed to use the LineA stuff, though, and something like
this will never work with fVDI (which neither reads nor writes the lineA
variables after startup time).

>> If not, then why do I have problems using VDI functions (vro_cpyfm for
>> example)?

Either don't change the resolution or don't use the VDI.

>> And the second question.
>> Will it work on Milan too? if not, then how should I change the

No.

>> resolution on Milan? (I have only F030).
>
>If Milan is anything like the Hades clone, changing the resolution

It most likely isn't possible to change the mode at all, and in any
case you'd have no way of telling it what you wanted.

>with a Milan might be able to be more specific. It would make more sense
>to have the program adjust itself to the current resolution, thus
>making your prg run on much more hardware, and future clones.

That's definitely the way to do it.

I've heard that some people have added new features to the VDI (not
clear on whether this is NVDI or some Milan/Hades specific VDI) to
make it more 'game friendly' (mode setting, back buffers, etc), but I
have not got any details on this.
Naturally, I would like to add this to fVDI too, but it's kind of hard
to standardise things which are done in secret...
If you have any ideas about features you'd like in a VDI, I'm open
to suggestions.

Hmm... :(

> With the standard VDI, it might be possible to get it to work by
> modifying a bunch of LineA variables, since it makes use of those.

OK. But Line-A is made speciall for ST modes (up to 16 colors). So I
can't change the number of colors to 256 or true color??? or am I wrong?

>>> If not, then why do I have problems using VDI functions (vro_cpyfm for

So, the best way is to adjust the picture to the current resolutions or
center it on the screen :-)) pretty good idea :)) I though about it
before....

Well, for me the most important thing is: sprite(s).
Yes, I know... ST/F030 has one sprite (mouse sprite), but it's only
16x16x2... make a bigger sprite (minimum 32x32 in 16 or even more colours).

Hi again :-))

OK. Another question concerning sound (XBIOS).
I'm trying to make some sound on my F030 for the game using XBIOS.
Everythinh goes fine except one thing ;)
How should I (or can I) change the frequency (using XBIOS calls)?
I'm going to use some non(??) standard frequencies (44100, 22050....).

And what is the best and easiest way to recognize, that a sample is done.
I have, that I should use Timer-A interrupt or monochrome detect
interrupt... but how? I've been trying to make it in many different ways.

Should it goes like this ? :
- Mfpint(13, myfunc)
- setinterrupt(0, 1)
- Jenabint

```
void myfunc(void)
{
printf("done");
}
```

Well, I think it was about the time the TT came out that Atari said that
LineA was no longer supported. To some degree it is even on the Falcon,
however, and I'm reasonably sure you'd be able to get the normal VDI
working by tweaking the right variables.
I'm not suggesting that it's a good idea, though.

>center it on the screen :-)) pretty good idea :)) I though about it

It may not be all that much fun to have a 320x200 game screen in the
middle of a 1600x1200 display, but it sure beats not having any at all. ;-)

>> If you have any ideas about features you'd like in a VDI, I'm open
>> to suggestions.
>
>Well, for me the most important thing is: sprite(s).

Unfortunately, none of the TOS machines have any sprite hardware, and
I'm not aware of any graphics cards that have them either.

>Yes, I know... ST/F030 has one sprite (mouse sprite), but it's only
>16x16x2... make a bigger sprite (minimum 32x32 in 16 or even more colours).

The mouse is not a sprite on the Atari TOS machines. It usually is on
graphics cards, though, but even there only one is available and it's
likely to be limited to two colours.

Without hardware support, sprites need to be faked in some way, and a
VDI function which did that would probably not fit the requirements of
all games, anyway.

Rather, I'd suggest something like:
- A specific 'blit to temporary buffer' function, which would keep things
  in local RAM on a graphics card.
- The reverse of the above, obviously.
- Masked blit (like on the Amiga), which would do the masking step at the
  same time as the actual blit.

These three together provide the same functionality as a sprite (well,
obviously there's no collision detection or anything like that).
(It would probably be better to generalize the first two with some kind
 of card memory allocation function.)

Hmm... I was trying to correct some variables but under NVDI ;)
I'll try without NVDI...

or I could adjust the picture to the correct resolution, but then the
picture can be 'pixelized'...

I'm doing it exactly in the way you said... :-)
But it's still a lot of work :-/

What type of interface does it have -- GEM, custom? A debugger that can
work under multiple resolutions would be ideal, it's one thing I dislike
about the Devpac debugger. So yes, please adapt it for other rez.

Look forward to trying it out.

Later,
Karlos.

HI

Does anyone know a way for a pc to read discs formatted on an atari st? Does any software exist that can do this

Would you be kind enough to send any reply to me personaly

Thanks for your help

> I 've read on "The Atari Compendium" and other documents that physical
> screenaddress must be aligned in boundary.
> What is that mean?? or where can i find a document that explains this
> question?

It means: the (physical) screen memory always starts at an adress that is a
multiple of the boundary.

On the STe and Falcon this is a word boundary (the screen adres is a
multiple of 2). This because the video hardware of those machines accesses
the memory at a word at a time.
On the TT it is a multiple of eight for the same reasone: the video hardware
of the TT works with 64 bits ate a time.
On the ST the videobase has to be a multiple of 256. This is because the is
no register to specify the least significant byte of the adress.

Hope this helpes a bit.

Hans

There is a little software : Windows Floppy Disk Copy v0.09b
http://musique.atari.org/atari/emul/others.htm

It'll be transform the ATARI disk in a disk image "*.st" than you can use
with any ATARI emulator : http://musique.atari.org/atari/emul/index.htm

Regards ...

Hi,

for those that don't read MiNT mailing list:

I need to know everything about HW registers $FF8006 and $FF8007
(Compendium is very wrong on these). Also, I would like to know how the
IDE interface HW regs are used (in which order they are programmed, how
to
construct logical sector number from the parameters etc). Also some IDE
registers TOS 4.04 uses are marked as N/A in Compendium so I would need
better doc on these as well.

BTW, doesn't someone have some routines that would emulate either
blitter
(except sources of STonX which I have but are a bit cryptic) or directly
the LineA routines in TOS 4.04? I would love to get rid of Blitter once
and for all...

Last but not least: how to enable memory test during boot (the line

right
below Atari Fuji logo) - I disabled it 7 years ago and I cannot find out
how to enable it :-)

I have some cool ideas but I need more informations. Hopefully you'll
help
me. Thanks.

Petr

I rather liked the Black Scorpion falcon only asm debugger. Very neat.

Can't say I've played with that one. Is it PD now? (or has it always
been?)

Later,
Karlos.

I'm using GFA Basic for a utility that will read all the files in a directory, modify, then save the new data with a new file name. I'm using FSFIRST and FSNEXT to read the directory. I then OPEN "I", #1... to read 1 file and OPEN "O", #2 ... to write the new file. Both files are CLOSEd (CLOSE #1 CLOSE #2) before going on to the next file.

This works fine except that I run out of memory for large directories. I can get around this by reserving a huge chunk of memory when compiling (2 megs), but why should this happen? How can I get OPEN #1 and OPEN #2 to use the same memory block each pass?
